## Safety notices

This manual contains information that you should observe to ensure your own personal safety and prevent material damage. The notices referring to your personal safety are highlighted in the manual by a warning triangle; notices that relate to material damage only have no warning triangle. The notices shown below are graded according to the level of hazard (from most to least hazardous):

---

### Danger

Indicates that death or serious injury **will** result if proper precautions are not taken.

---

---

### Warning

Indicates that death or serious injury **may** result if proper precautions are not taken.

---

---

### Caution

With a warning triangle, indicates that minor injury **may** result if proper precautions are not taken.

---

---

### Caution

Without a warning triangle, indicates that material damage may result if proper precautions are not taken.

---

---

### Notice

Indicates that an undesirable result or state may occur if the corresponding instructions are not observed.

---

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A warning notice with a warning triangle indicating possible personal injury may also include a warning relating to material damage.

## Qualified Personnel

The associated device/system may only be installed and operated in conjunction with this documentation. The device/system may only be commissioned and operated by **qualified personnel**. For the purpose of the safety notices in this documentation, "qualified personnel" are those authorized to commission, ground, and label equipment, systems, and circuits in accordance with established safety procedures.

## Proper Use of Siemens Products

Please observe the following:

---

### Warning

Siemens products are only permitted to be used for the applications specified in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. To ensure proper and safe operation of these products, they must be correctly transported, stored, set up, mounted, installed, commissioned, operated, and maintained. The permissible ambient conditions must be met. Information in the associated documentation must be observed.

---

# Preface

## **SINAMICS documentation**

The SINAMICS documentation is organized in the following categories:

- General documentation/catalogs
- Manufacturer/service documentation

## **More information**

Information on the following topics is available under the link:

- Ordering documentation/overview of documentation
- Additional links to download documents
- Using documentation online (find and search in manuals/information).

<http://www.siemens.com/motioncontrol/docu>

## **My Documentation Manager**

Information on how to produce individual contents for your own machine documentation based on Siemens contents is available under the link:

<http://www.siemens.com/mdm>

## **Training**

Information about SITRAIN (Siemens Training on products, systems and solutions for automation) is available under the following link:

<http://www.siemens.com/sitrain>

## **FAQs**

You can find Frequently Asked Questions in the Service&Support pages under Product Support:

<http://support.automation.siemens.com>

## **SINAMICS**

You can find information on SINAMICS at:

<http://www.siemens.com/sinamics>

## Usage phases and their tools/documents (as an example)

Table Preface-1 Usage phases and the available tools/documents

Usage phase	Tools/documents
Orientation	SINAMICS G Sales Documentation
Planning/configuration	SIZER configuration tool Configuration Manuals, Motors
Decision making / ordering	SINAMICS G Catalogs
Installation/assembly	<ul style="list-style-type: none"> <li>• SINAMICS G150 Operating Instructions</li> <li>• SINAMICS G130 Operating Instructions</li> </ul>
Commissioning	<ul style="list-style-type: none"> <li>• STARTER commissioning tool</li> <li>• SINAMICS G150 Operating Instructions</li> <li>• SINAMICS G130 Operating Instructions</li> </ul>
Usage/operation	<ul style="list-style-type: none"> <li>• SINAMICS G150 Operating Instructions</li> <li>• SINAMICS G130 Operating Instructions</li> </ul>
Maintenance/servicing	<ul style="list-style-type: none"> <li>• SINAMICS G150 Operating Instructions</li> <li>• SINAMICS G130 Operating Instructions</li> </ul>

## Target group

This documentation is aimed at machine manufacturers, commissioning engineers, and service personnel who use SINAMICS.

## Benefits

This documentation contains the comprehensive information about parameters, function diagrams and faults and alarms required to commission and service the system.

This manual should be used in addition to the other manuals and tools provided for the product.

**Standard scope**

The scope of the functionality described in this document can differ from the scope of the functionality of the drive system that is actually supplied.

- Other functions not described in this documentation might be able to be executed in the drive system. This does not, however, represent an obligation to supply functions of this kind when new equipment is delivered or during servicing.
- The documentation can also contain descriptions of functions that are not available in a particular product version of the drive system. The functionalities of the supplied drive system should only be taken from the ordering documentation.
- Extensions or changes made by the machine manufacturer must be documented by the machine manufacturer.

For reasons of clarity, this documentation does not contain all of the detailed information on all of the product types. This documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

**Search tools**

The following guides are provided to help you locate information in this manual:

1. Table of contents
  - General table of contents for the complete manual (after the preface).
  - Table of contents for function diagrams (Section 2.1).
2. List of abbreviations
3. List of references
4. Index

**Technical Support**

Country-specific telephone numbers for technical support are provided on the Internet at:

<http://www.siemens.com/automation/service&support>

## Contents

1.1	Overview of parameters	1-12
1.2	List of parameters	1-31
1.3	Parameters for data sets	1-951
1.4	Parameters for write protection and know-how protection	1-967

## 1.1 Overview of parameters

### 1.1.1 Explanation of parameter list

#### Basic structure of parameter descriptions

The data in the following example has been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The parameter list (See Section 1.2) is structured as follows:

----- Start of example -----

<b>pxxxx[0...n]</b>	<b>BICO: Long parameter name / short parameter name</b>			
Drive object (function module)	<b>Can be changed:</b> C1(x), C2(x), U, T	<b>Calculated:</b> CALC_MOD_REG	<b>Access level:</b> 2	
	<b>Data type:</b> Unsigned32/Integer16	<b>Dynamic index:</b> CDS, p0170	<b>Function diagram:</b> 2080	
	<b>P group:</b> Closed-loop control	<b>Unit group:</b> 7_1	<b>Unit selection:</b> p0505	
	<b>Not for motor type:</b> FEM	<b>Scaling:</b> p2000	<b>Expert list:</b> 1	
	<b>Min</b> 0.00 [Nm]	<b>Max</b> 10.00 [Nm]	<b>Factory setting</b> 0.00 [Arms]	
<b>Description:</b>	Text			
<b>Values:</b>	0:      Name and meaning of value 0 1:      Name and meaning of value 1 2:      Name and meaning of value 2 etc.			
<b>Recommendation:</b>	Text			
<b>Index:</b>	[0] = Name and meaning of index 0 [1] = Name and meaning of index 1 [2] = Name and meaning of index 2 etc.			
<b>Bit array:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>
	00	Name and meaning of bit 0	Yes	No
	01	Name and meaning of bit 1	Yes	No
	02	Name and meaning of bit 2	Yes	No
		etc.		
				<b>FP</b>
				8010
				-
				8012
<b>Dependency:</b>	Text See also: pxxxx, rxxxx See also: Fxxxx, Axxxx			
<b>Danger:</b>	<b>Warning:</b>	<b>Caution:</b>	Safety notices with a warning triangle	
				
<b>Caution:</b>	<b>Notice:</b>		Safety notices without a warning triangle	
<b>Note:</b>	Information which might be useful.			

----- End of example -----

**pxxxx[0...n]    Parameter number**

The parameter number is made up of a "p" or "r", followed by the parameter number and the index (optional).

Examples of representation in the parameter list:

- p...                      Adjustable parameter (read and write parameter)
- r...                      Display parameter (read-only)
- p0918                    Adjustable parameter 918
- p0099[0...3]          Adjustable parameter 99, indices 0 to 3
- p1001[0...n]          Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944                    Display parameter 944

Other examples of the notation used in the documentation:

- p1070[1]                Adjustable parameter 1070, index 1
- p2098[1].3             Adjustable parameter 2098, index 1 bit 3
- r0945[2](3)            Display parameter 945, index 2 of drive object 3
- p0795.4                Adjustable parameter 795, bit 4
- r2129.0...15          Display parameter 2129 with bit array (maximum 16 bits)

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions or parameters:

- Execute macros  
p0015, p0700, p1000, p1500
- Set PROFIBUS telegram (BICO interconnections)  
p0922
- Set component lists  
p0230, p0300, p0301, p0400
- Automatic calculation and pre-assignment  
p0112, p0340, p0578, p3900
- Restore factory settings  
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square brackets.

---

**Note:**

The parameter list can contain parameters that are not visible in the expert lists of the respective commissioning software (e.g. parameters for trace functions).

---

**BICO: Long parameter name / short parameter name**

The following abbreviations can appear in front of the parameter name:

- **BI:** Binector Input  
This parameter is used for selecting the source of a digital signal.
- **BO:** Binector Output  
This parameter is available as a digital signal for interconnection with other parameters.
- **CI:** Connector Input  
This parameter is used for selecting the source of an "analog" signal.
- **CO:** Connector Output  
This parameter is available as an "analog" signal for interconnection with other parameters.
- **CO/BO:** Connector/Binector Output  
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

---

**Note:**

A connector input (CI) cannot be just interconnected with any connector output (CO, signal source).

When interconnecting a connector input using the commissioning software, only the corresponding possible signal sources are listed.

---

### Drive object (function module)

A drive object (DO) is an independent, "self-contained" functional unit that has its own parameters and, in some cases, faults and alarms.

When carrying out commissioning using the commissioning software, you can select/deselect additional functions and their parameters by activating/deactivating function modules accordingly.

The parameter list specifies the associated drive object and function module for each individual parameter.

Examples:

- p1070 CI: Main setpoint  
VECTOR  
The parameter is only available with the VECTOR drive object, regardless of which function modules have been activated.
- p1055 BI: Jog bit 0  
VECTOR  
The parameter is available with the VECTOR drive object, regardless of which function modules have been activated (i.e. it is available with every activated function module belonging to the drive object).

A parameter can belong to one, several or all drive objects.

The following information relating to "Drive object" and "Function module" can be displayed under the parameter number:

Table 1-1 Data in the "Drive object (function module)" field

Drive object (function module)	Type	Meaning
All objects	-	All drive objects have this parameter.
B_INF	30	Basic Infeed Control Unregulated line infeed unit (without feedback) for rectifying the line voltage of the DC link
B_INF (parallel)	-	Basic Infeed with "Parallel connection" function module (r0108.15).
B_INF (brk mod ext)	-	Basic Infeed with "Braking Module External" function module (r0108.26).
B_INF (cooling unit)	-	Basic Infeed with "Cooling unit" function module (r0108.28)
B_INF (PROFINET)	-	Basic Infeed with "PROFINET" function module (r0108.31).
CU_G130_DP		Control Unit SINAMICS G130 with PROFIBUS interface.
CU_G130_DP (CAN)	-	Control Unit SINAMICS G130 with PROFIBUS interface and function module "CAN" (p0108.29).
CU_G130_DP (COMM BOARD)		Control Unit SINAMICS G130 with PROFIBUS interface and "COMM board" function module (p0108.30).
CU_G130_DP (PROFINET)	-	Control Unit SINAMICS G130 with PROFIBUS interface and function module "PROFINET" (p0108.31).
CU_G130_PN		Control Unit SINAMICS G130 with PROFINET interface.

Table 1-1 Data in the "Drive object (function module)" field, continued

Drive object (function module)	Type	Meaning
CU_G130_PN (CAN)	-	Control Unit SINAMICS G130 with PROFINET interface and function module "CAN" (p0108.29).
CU_G130_PN (COMM BOARD)		Control Unit SINAMICS G130 with PROFINET interface and "COMM board" function module (p0108.30 ).
CU_G130_PN (PROFINET)		Control Unit SINAMICS G130 with PROFINET interface and function module "PROFINET" (p0108.31).
CU_G150_DP		Control Unit SINAMICS G150 with PROFIBUS interface.
CU_G150_DP (CAN)	-	Control Unit SINAMICS G150 with PROFIBUS interface and function module "CAN" (p0108.29).
CU_G150_DP (COMM BOARD)		Control Unit SINAMICS G150 with PROFIBUS interface and "COMM board" function module (p0108.30 ).
CU_G150_DP (PROFINET)	-	Control Unit SINAMICS G150 with PROFIBUS interface and function module "PROFINET" (p0108.31).
CU_G150_PN		Control Unit SINAMICS G150 with PROFINET interface.
CU_G150_PN (CAN)	-	Control Unit SINAMICS G150 with PROFINET interface and function module "CAN" (p0108.29).
CU_G150_PN (COMM BOARD)		Control Unit SINAMICS G150 with PROFINET interface and "COMM board" function module (p0108.30 ).
CU_G150_PN (PROFINET)		Control Unit SINAMICS G150 with PROFINET interface and function module "PROFINET" (p0108.31).
ENC	300	Object for a DRIVE-CLiQ encoder.
HUB	150	DRIVE-CLiQ Hub Module.
TB30	100	Terminal Board 30.
TM150	208	Terminal Module 150.
TM31	200	Terminal Module 31.
TM54F_MA	205	Terminal Module 54F Master.
TM54F_SL	206	Terminal Module 54F Slave.
VECTOR_G	12	Vector drive for SINAMICS G130/G150.
VECTOR_G (n/M)	-	Vector drive for SINAMICS G130/G150 with "Speed/torque control" function module (r0108.2).
VECTOR_G (Safety red)	-	Vector drive for SINAMICS G130/G150 with "Safety rotary axis" function module (r0108.13).
VECTOR_G (ext. brake)	-	Vector drive for SINAMICS G130/G150 with "Extended brake control" function module (r0108.14).
VECTOR_G (parallel)	-	Vector drive for SINAMICS G130/G150 with "Parallel connection" function module (r0108.15).
VECTOR_G (Tech_ctrl)	-	Vector drive for SINAMICS G130/G150 with "Technology controller" function module (r0108.16).
VECTOR (ext. mess.)	-	Vector drive for SINAMICS G130/G150 with "Extended messages/monitoring functions" function module (r0108.17).

Table 1-1 Data in the "Drive object (function module)" field, continued

Drive object (function module)	Type	Meaning
VECTOR_G (cooling unit)	-	Vector drive for SINAMICS G130/G150 with "Cooling unit" function module (r0108.28).
VECTOR_G (CAN)	-	Vector drive for SINAMICS G130/G150 with "CAN" function module (r0108.29).
VECTOR_G (PROFINET)	-	Vector drive for SINAMICS G130/G150 with "PROFINET" function module (r0108.31).

---

**Note:**

The drive object type is used to identify the drive objects in the drive system (e.g. r0107, r0975[1]).

---

**Can be changed**

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C1(x), C2(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive object state and that the change will not take effect until the object switches to another state. One or more states are possible.

The following states may be specified:

- C1(x) Device commissioning                      C1: **Commissioning 1**  
     Device commissioning is in progress (p0009 > 0).  
     Pulses cannot be enabled.  
     The parameter can only be changed when the device commissioning settings (p0009 > 0) are as follows:
  - C1: Can be changed for all settings p0009 > 0.
  - C1(x): Can only be changed when the settings are p0009 = x
 A modified parameter value does not take effect until device commissioning mode is exited with p0009 = 0.
- C2(x) Drive object commissioning                      C2: **Commissioning 2**  
     Drive commissioning is in progress (p0009 = 0 and p0010 > 0).  
     Pulses cannot be enabled.  
     The parameter can only be changed when the drive commissioning settings (p0010 > 0) are as follows:
  - C2: Can be changed for all settings p0010 > 0
  - C2(x): Can only be changed when the settings are p0010 = x
 A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
- U      Operation    U: **Run**  
     Pulses are enabled.
- T      Ready for operation                                      T: **Ready to run**  
     The pulses are not enabled and the status "C1(x)" or "C2(x)" is not active.

---

**Note:**

Parameter p0009 is CU-specific (available on the Control Unit).

Parameter p0010 is drive-specific (available for each drive object).

The operating state of individual drive objects is displayed in r0002.

---

**Calculated**

Specifies whether the parameter is influenced by automatic calculations.

The calculation attribute defines which activities influence the parameter.

The following attributes apply:

- CALC\_MOD\_ALL
  - p0340 = 1
  - Project download with commissioning software and send from p0340 = 3
- CALC\_MOD\_CON
  - p0340 = 1, 3, 4
- CALC\_MOD\_EQU
  - p0340 = 1, 2
- CALC\_MOD\_LIM\_REF
  - p0340 = 1, 3, 5
  - p0578 = 1
- CALC\_MOD\_REG
  - p0340 = 1, 3

---

**Note:**

For p3900 > 0, p0340 = 1 is also called automatically.

After p1910 = 1, p0340 = 3 is also called automatically.

---

**Access level**

Specifies the access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard
  - 2: Extended
  - 3: Expert
  - 4: Service
- Parameters with this access level are password protected.

---

**Note:**

Parameter p0003 is CU-specific (available on the Control Unit).

---

**Data type**

The information on the data type can consist of the following two items (separated by a slash):

- First item  
Data type of the parameter.
- Second item (for binector or connector input only)  
Data type of the signal source to be interconnected (binector/connector output).

Parameters can have the following data types:

- I8 Integer8 8-bit integer
- I16 Integer16 16-bit integer
- I32 Integer32 32-bit integer
- U8 Unsigned8 8 bits without sign
- U16 Unsigned16 16 bits without sign
- U32 Unsigned32 32 bits without sign
- Float FloatingPoint32 32-bit floating-point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when BICO interconnections are established:

Table 1-2 Possible combinations of BICO interconnections

	BICO input parameter			
	CI parameter			BI parameter
BICO output parameter	Unsigned32/Integer16	Unsigned32/Integer32	Unsigned32/FloatingPoint32	Unsigned32/Binary
CO: Unsigned8	x	x	—	—
CO: Unsigned16	x	x	—	—
CO: Integer16	x	x	—	—
CO: Unsigned32	x	x	—	—
CO: Integer32	x	x	—	—
CO: FloatingPoint32	x	x	x <sup>1</sup>	—
BO: Unsigned8	—	—	—	x
BO: Unsigned16	—	—	—	x
Legend: x: BICO interconnection permitted —: BICO interconnection not permitted				
1 Exception: BICO input parameters with data type "Unsigned32/FloatingPoint32" can also be interconnected with the following BICO output parameters, although these are not of the "FloatingPoint32" data type: CO: r8850, CO: r8860, CO: r2050, CO: r2060				

Table 1-2 Possible combinations of BICO interconnections, continued

	BICO input parameter			
	CI parameter			BI parameter
BICO output parameter	Unsigned32/Integer16	Unsigned32/Integer32	Unsigned32/FloatingPoint32	Unsigned32/Binary
BO: Integer16	–	–	–	x
BO: Unsigned32	–	–	–	x
BO: Integer32	–	–	–	x
BO: FloatingPoint32	–	–	–	–
Legend: x: BICO interconnection permitted –: BICO interconnection not permitted				
1 Exception: BICO input parameters with data type "Unsigned32/FloatingPoint32" can also be interconnected with the following BICO output parameters, although these are not of the "FloatingPoint32" data type: CO: r8850, CO: r8860, CO: r2050, CO: r2060				

## Dynamic index

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

This field can contain the following information:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)
- "p2615" (traversing blocks count)

Table 1-4 Unit groups (p0349)

Unit group	Unit selection for p0349 =		Reference variable at %
	1	2	
15_1	mH	%	$\frac{1000 \cdot p0304}{2 \cdot \pi \cdot \sqrt{3} \cdot p0305 \cdot p0310}$
16_1	Ohm	%	$\frac{p0304}{\sqrt{3} \cdot p0305}$

Table 1-5 Unit groups (p0505)

Unit group	Unit selection for p0505 =				Reference variable at %
	1	2	3	4	
2_1	Hz	%	Hz	%	p2000
2_2	kHz	%	kHz	%	p2000
3_1	rpm	%	rpm	%	p2000
4_1	m/min	%	ft/min	%	p2000
4_2	m/min	m/min	ft/min	ft/min	-
5_1	Vrms	%	Vrms	%	p2001
5_2	V	%	V	%	p2001
5_3	V	%	V	%	p2001
6_1	mA <sub>rms</sub>	%	mA <sub>rms</sub>	%	p2002
6_2	A <sub>rms</sub>	%	A <sub>rms</sub>	%	p2002
6_3	mA	%	mA	%	p2002
6_4	A	%	A	%	p2002
6_5	A	%	A	%	p2002
7_1	Nm	%	lbf ft	%	p2003
7_2	Nm	Nm	lbf ft	lbf ft	-

Table 1-6 Unit group (p0595)

Unit group	Unit selection for p0595 =		Reference variable at %
	Value	Unit	
9_1	The values that can be set and the technological units are shown in p0595 (See Section 1.2).		

**Parameter values**

Min	Minimum value of the parameter [unit]
Max	Maximum value of the parameter [unit]
Factory setting	Value when shipped [unit]  In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0].  A different value may be displayed for certain parameters (e.g. p1800) during first commissioning. Reason: The setting for these parameters is determined by the operating environment of the Control Unit (e.g. depending on the device type, macro, or power unit).

---

**Note:**

For SINAMICS G130/G150, the macros and their settings are provided in the following documentation:

SINAMICS G130/G150 Operating Instructions

---

**Not for motor type**

Specifies for which motor type this parameter has no significance.

ASM: Induction motor

FEM: Separately excited synchronous motor

PEM: Permanent-magnet synchronous motor

REL: Reluctance motor / SIEMOSYN motor

**Scaling**

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100%

### Expert list

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software.

1: Parameter is available in the expert list.

0: Parameter is not available in the expert list.

---

#### Notice:

Users assume full responsibility for using parameters marked "Expert list: 0" (parameter does not exist in the expert list).

These parameters and their functionalities have not been tested and no further user documentation is available for them (e.g. description of functions). Moreover, no support is provided for these parameters by "Technical Support" (hotline).

---

### Description

Explanation of the function of a parameter.

### Values

List of the possible values of a parameter.

### Recommendation

Information about recommended settings.

### Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) for indexed adjustable parameters:

- Min, Max:

The adjustment range and unit apply to all indices.

- Factory setting:

When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.

When the indices have different factory settings, they are all listed individually with the unit.

**Bit array**

For parameters with bit arrays, the following information is provided about each bit:

- Bit number and signal name
- Meaning with signal states 0 and 1
- Function diagram (optional)

The signal is shown on this function diagram.

**Dependency**

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

See also: List of other relevant parameters to be considered.

**Safety notices**

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

**Danger**

The description of this safety notice can be found at the beginning of this manual (see **Safety notices**).

**Warning**

The description of this safety notice can be found at the beginning of this manual (see **Safety notices**).

**Caution**

The description of this safety notice can be found at the beginning of this manual (see **Safety notices**).

**Caution**

The description of this safety notice can be found at the beginning of this manual (see **Safety notices**).

**Notice**

The description of this safety notice can be found at the beginning of this manual (see **Safety notices**).

**Note**

Information that the user may find useful.

### 1.1.2 Number ranges of parameters

**Note:**

The following number ranges represent an overview for all of the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in Section 1.2.

Parameters are grouped into the following number ranges:

Table 1-7 Number ranges for SINAMICS

Range		Description
From	To	
0000	0099	Display and operation
0100	0199	Commissioning
0200	0299	Power unit
0300	0399	Motor
0400	0499	Encoder
0500	0599	Technology and units, motor-specific data, probes
0600	0699	Thermal monitoring, maximum current, operating hours, motor data, central probe
0700	0799	Control Unit terminals, measuring sockets
0800	0839	CDS, DDS data sets, motor changeover
0840	0879	Sequence control (e.g. signal source for ON/OFF1)
0880	0899	ESR, parking, control and status words
0900	0999	PROFIBUS/PROFIdrive
1000	1199	Setpoint channel (e.g. ramp-function generator)
1200	1299	Functions (e.g. motor holding brake)
1300	1399	V/f control
1400	1799	Control
1800	1899	Gating unit
1900	1999	Power unit and motor identification
2000	2009	Reference values
2010	2099	Communication (fieldbus)
2100	2139	Faults and alarms
2140	2199	Signals and monitoring
2200	2359	Technology controller
2360	2399	Staging, hibernation

Table 1-7 Number ranges for SINAMICS, continued

Range		Description
From	To	
2500	2699	Position control (LR) and basic positioning (EPOS)
2700	2719	Reference values, display
2720	2729	Load gear
2800	2819	Logic operations
2900	2930	Fixed values (e.g. per cent, torque)
3000	3099	Motor identification results
3100	3109	Real time clock (RTC)
3110	3199	Faults and alarms
3200	3299	Signals and monitoring
3400	3659	Infeed control
3660	3699	Voltage Sensing Module (VSM), Braking Module internal
3700	3779	Advanced Positioning Control (APC)
3780	3819	Synchronization
3820	3849	Friction characteristic
3850	3899	Functions (e.g. long stator)
3900	3999	Management
4000	4599	Terminal Board, Terminal Module (e.g. TB30, TM31)
4600	4699	Sensor Module
4700	4799	Trace
4800	4849	Function generator
4950	4999	OA application
5000	5169	Spindle diagnostics
5400	5499	Line droop control (e.g. shaft generator)
5500	5599	Dynamic grid support (solar)
5600	5613	PROFInergy
5900	6999	SINAMICS GM/SM/GL/SL
7000	7499	Parallel connection of power units
7500	7599	SINAMICS SM120
7700	7729	External signals
7770	7789	NVRAM, system parameters
7800	7839	EEPROM read/write parameters
7840	8399	Internal system parameters
8400	8449	Real time clock (RTC)
8500	8599	Data and macro management

Table 1-7 Number ranges for SINAMICS, continued

Range		Description
From	To	
8600	8799	CAN bus
8800	8899	Communication Board Ethernet (CBE), PROFIdrive
8900	8999	Industrial Ethernet, PROFINET, CBE20
9000	9299	Topology
9300	9399	Safety Integrated
9400	9499	Parameter consistency and storage
9500	9899	Safety Integrated
9900	9949	Topology
9950	9999	Diagnostics, internal
10000	10199	Safety Integrated
11000	11299	Free technology controller 0, 1, 2
20000	20999	Free function blocks (FBLOCKS)
21000	25999	Drive Control Chart (DCC)
50000	53999	SINAMICS DC MASTER (DC control)
61000	61001	PROFINET

## 1.2 List of parameters

Product: SINAMICS G130/G150, Version: 4502400, Language: eng  
Objects: B\_INF, CU\_G130\_DP, CU\_G130\_PN, CU\_G150\_DP, CU\_G150\_PN, ENC, HUB, TB30, TM150, TM31, TM54F\_MA, TM54F\_SL, VECTOR\_G

<b>r0002 Infeed operating display / INF op_display</b>			
<b>B_INF</b>	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0 <b>Max</b> 250	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 250	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Operating display for the infeed.		
<b>Value:</b>	0: Operation - everything enabled 31: Rdy for sw on - pre-chrg running (p0857) 32: Ready for switching on - set "ON/OFF1" = "0/1" (p0840) 35: Switching on inhibited - carry out first commissioning (p0010) 41: Switching on inhibited - set "ON/OFF1" = "0" (p0840) 42: Switching on inhibited - set "OC/OFF2" = "1" (p0844, p0845) 44: Switching on inhibited - connect 24 V to terminal EP (hardware) 45: Switching on inhibited - remove fault cause, acknowledge fault 46: Switching on inhibited - exit comm mode (p0009, p0010) 60: Infeed de-activated/not operational 70: Initialization 200: Wait for booting/partial booting 250: Device signals a topology error		
<b>Dependency:</b>	Refer to: r0046		
<b>Notice:</b>	For several missing enable signals, the corresponding value with the highest number is displayed.		
<b>Note:</b>	OC: Operating condition COMM: Commissioning		

<b>r0002 Control Unit operating display / CU op_display</b>			
<b>CU_G130_DP,</b> <b>CU_G130_PN,</b> <b>CU_G150_DP,</b> <b>CU_G150_PN</b>	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0 <b>Max</b> 117	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 117	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Operating display for the Control Unit (CU).		
<b>Value:</b>	0: Operation 10: Ready 20: Wait for run-up 25: Wait for automatic FW update of DRIVE-CLiQ components 31: Commissioning software download active 33: Remove/acknowledge topology error 34: Exit commissioning mode 35: Carry out first commissioning 70: Initialization 80: Reset active 99: Internal software error 101: Specify topology 111: Insert drive object 112: Delete drive object 113: Change drive object number 114: Change component number 115: Run parameter download 117: Delete component		
<b>Notice:</b>	For several missing enable signals, the corresponding value with the highest number is displayed.		

<b>r0002 Encoder DO operating display / Enc DO op_display</b>			
ENC	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 250	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Operating display for encoder drive object		
<b>Value:</b>	0: Encoder in cyclic operation 35: Carry out first commissioning (p0010) 45: Remove fault cause, acknowledge fault 46: Exit commissioning mode (p0009, p0010) 60: Encoder de-activated 200: Wait for booting/partial booting 250: Device signals a topology error		
<b>Notice:</b>	For several missing enable signals, the corresponding value with the highest number is displayed.		
<b>r0002 DRIVE-CLiQ Hub Module operating display / Hub op_display</b>			
HUB	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 250	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Operating display for the DRIVE-CLiQ Hub Module.		
<b>Value:</b>	0: Module in cyclic operation 40: Module not in cyclic operation 50: Alarm 60: Fault 70: Initialization 120: Module de-activated 200: Wait for booting/partial booting 250: Device signals a topology error		
<b>Notice:</b>	For several missing enable signals, the corresponding value with the highest number is displayed.		
<b>r0002 TB30 operating display / TB30 op_display</b>			
TB30	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 250	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Operating display for Terminal Board 30 (TB30).		
<b>Value:</b>	0: Module in cyclic operation 40: Module not in cyclic operation 60: Fault 70: Initialization 80: Reset active 120: Module de-activated 200: Wait for run-up 250: Device signals a topology error		
<b>Notice:</b>	For several missing enable signals, the corresponding value with the highest number is displayed.		

<b>r0002</b>

<b>Description:</b>	Operating display for the drive.		
<b>Value:</b>	0: Operation - everything enabled 10: Operation - set "enable setpoint" = "1" (p1142, p1152) 11: Operation - set "enable speed controller" = "1" (p0856) 12: Operation - RFG frozen, set "RFG start" = "1" (p1141) 13: Operation - set "enable RFG" = "1" (p1140) 14: Oper. - MotID, excit. running and/or brake opens, SS2, SOS 15: Operation - open brake (p1215) 16: Operation - withdraw braking with OFF1 using "ON/OFF1" = "1" 17: Operation - braking with OFF3 can only be interrupted with OFF2 18: Operation - brake on fault, remove fault, acknowledge 19: Operation - armature short-circ./DC brake act. (p1230, p1231) 21: Ready for operation - set "Operation enable" = "1" (p0852) 22: Ready for operation - de-magnetizing running (p0347) 23: Ready for operation - set "Infeed operation" = "1" (p0864) 31: Ready for switching on - set "ON/OFF1" = "0/1" (p0840) 35: Switching on inhibited - carry out first commissioning (p0010) 41: Switching on inhibited - set "ON/OFF1" = "0" (p0840) 42: Switching on inhibited - set "OC/OFF2" = "1" (p0844, p0845) 43: Switching on inhibited - set "OC/OFF3" = "1" (p0848, p0849) 44: Switching on inhibited - connect 24 V to terminal EP (hardware) 45: Switching on inhibited - rectify fault, acknowledge fault, STO 46: Switching on inhibited - exit comm mode (p0009, p0010) 60: Drive object de-activated/not operational 70: Initialization 200: Wait for booting/partial booting 250: Device signals a topology error		
<b>Dependency:</b>	Refer to: r0046		
<b>Notice:</b>	For several missing enable signals, the corresponding value with the highest number is displayed.		
<b>Note:</b>	OC: Operating condition EP: Enable Pulses (pulse enable) RFG: Ramp-function generator COMM: Commissioning MotID: Motor data identification SS2: Safe Stop 2 SOS: Safe Operating Stop STO: Safe Torque Off		

<b>p0003</b>	<b>BOP access level / BOP acc_level</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> C1, U, T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the access level for reading and writing parameters via the Basic Operator Panel (BOP).		

**Value:**

- 1: Standard
- 2: Extended
- 3: Expert
- 4: Service

**Note:**

Access level 1 (standard):  
Parameters for simplest possible operations.

Access level 2 (extended):  
Parameters to operate the basic functions of the drive unit.

Access level 3 (experts):  
Expert know-how is required for these parameters (e.g. BICO parameterization).

Access level 4 (service):  
For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

- 99: Drive Data Sets (DDS)

**Dependency:** Refer to: p0003

**Notice:** The display filter via p0004 provides precise filtering and displays the corresponding parameters only when p0009 and p0010 = 0.

**Note:**

The set access level via p0003 is also relevant for the display filter via p0004.

Examples (assumption: p0009 = p0010 = 0):

p0003 = 1, p0004 = 3  
--> Only the parameters for the motor with access level 1 are displayed.

p0003 = 2, p0004 = 3  
--> Only the parameters for the motor with access levels 1 and 2 are displayed.

<b>p0005[0...1]</b>	<b>BOP operating display selection / BOP op_disp sel</b>		
All objects	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> [0] 2 [1] 0
<b>Description:</b>	Sets the parameter number and parameter index for display for p0006 = 2, 4 for the Basic Operator Panel (BOP). Examples for the SERVO drive object: p0005[0] = 21, p0005[1] = 0: Actual speed smoothed (r0021) p0005[0] = 25, p0005[1] = 0: Output voltage smoothed (r0025)		
<b>Index:</b>	[0] = Parameter number [1] = Parameter index		
<b>Dependency:</b>	Refer to: p0006		
<b>Note:</b>	Procedure: 1. The parameter number to be displayed should be set in index 0. Only the monitoring parameters (read-only parameters) can be set that actually exist for the actual drive object. If the set parameter number is not indexed, or if there is an index in index 1 that lies outside the valid range of the set parameter, then index 1 is automatically set to 0. 2. The index that belongs to the parameter set in index 0 should be set in index 1. The permissible changes in index 1 always depend on the parameter number set in index 0.		
<b>p0006</b>	<b>BOP operating display mode / BOP op_disp mode</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 4
<b>Description:</b>	Sets the mode of the operating display for the Basic Operator Panel (BOP) in the operating states "ready for operation" and "operation".		
<b>Value:</b>	0: Operation --> r0021, otherwise r0020 <--> r0021 1: Operation --> r0021, otherwise r0020 2: Operation --> p0005, otherwise p0005 <--> r0020 3: Operation --> r0002, otherwise r0002 <--> r0020 4: p0005		
<b>Dependency:</b>	Refer to: p0005		
<b>Note:</b>	Mode 0 ... 3 can only be selected if also r0020, r0021 are available on the drive object. Mode 4 is available for all drive objects.		

<b>p0006</b>	<b>BOP operating display mode / BOP op_disp mode</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN, ENC, HUB, TB30, TM150, TM31, TM54F_MA, TM54F_SL	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1
	<b>Min</b> 4	<b>Max</b> 4	<b>Factory setting</b> 4
<b>Description:</b>	Sets the mode of the operating display for the Basic Operator Panel (BOP) in the operating states "ready for operation" and "operation".		
<b>Value:</b>	4: p0005		
<b>Dependency:</b>	Refer to: p0005		
<b>Note:</b>	Mode 0 ... 3 can only be selected if also r0020, r0021 are available on the drive object. Mode 4 is available for all drive objects.		
<b>p0007</b>	<b>BOP background lighting / BOP lighting</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 <b>P-Group:</b> - <b>Not for motor type:</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1
	<b>Min</b> 0 [s]	<b>Max</b> 2000 [s]	<b>Factory setting</b> 0 [s]
<b>Description:</b>	Sets the delay time until the background lighting of the Basic Operator Panel (BOP) is switched off. If no keys are actuated, then the background lighting automatically switches itself off after this time has expired.		
<b>Note:</b>	p0007 = 0: Background lighting is always switched on (factory setting).		
<b>p0008</b>	<b>BOP drive object after booting / BOP DO after boot</b>

	<b>Min</b> 1	<b>Max</b> 65535	<b>Factory setting</b> 1
<b>Description:</b>	Sets the required drive object that is active at the Basic Operator Panel (BOP) after booting.		
<b>Note:</b>	The value from p0008 initializes the display on the Basic Operator Panel (BOP) at the top left after booting. The drive object Control Unit is selected using the value 1.		
<b>p0009</b>	<b>Device commissioning parameter filter / Dev comm par_filt</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> C1, T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> -	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 10000	<b>Factory setting</b> 1
<b>Description:</b>	Sets the device and basic drive commissioning. By appropriately setting this parameter, those parameters are filtered that can be written into in the various commissioning steps.		
<b>Value:</b>	0: Ready 1: Device configuration 2: Defining the drive type/function module 3: Drive base configuration 4: Data set base configuration		

29:	Device download
30:	Parameter reset
50:	OA application configuration
55:	OA application installation
101:	Topology input
111:	Insert drive object
112:	Delete drive object
113:	Change drive object number
114:	Change component number
115:	Parameter download
117:	Delete component
10000:	Ready (asynchron)

**Notice:** For p0009 = 10000 the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** The drives can only be powered up outside the device commissioning (the inverter enabled). In this case, p0009 must be 0 (Ready) and the individual drive objects must have already gone into operation (p0010).

p0009 = 1: Device configuration

At the first commissioning of the device, after booting, the device is in the "device configuration" state. To start the internal automatic first commissioning of the drive unit, p0009 should be set to 0 (Ready) after the ID for the actual topology (r0098) was transferred into the ID for the target topology (p0099). To do this, it is sufficient to set a single index value of p0099[x] the same as r0098[x]. Before the device has been completely commissioned, no other parameter can be changed. After the first commissioning was carried out, in this state, when required, other basic device configuration parameters can be adapted (e.g. the basic sampling time in p0110).

p0009 = 2: Defines the drive type / function module

In this state, the drive object types and/or the function modules can be changed or selected for the individual drive objects. To do this, the drive object type can be set using p0107[0...15] and the function can be set using p0108[0...15] (refer to p0101[0...15]).

p0009 = 3: Drive basic configuration

In this state, after the device has been commissioned for the first time, basic changes can be made for the individual drive objects (e.g. sampling times in p0111, p0112, p0115 and the number of data sets in p0120, p0130, p0140, p0170, p0180).

p0009 = 4: Data set basic configuration

In this state, after the device has been commissioned for the first time, for the individual drive objects changes can be made regarding the assignment of the components (p0121, p0131, p0141, p0151, p0161) to the individual data sets and the assignment of the power unit, motor and encoder to the drive data sets (p0185, ...).

p0009 = 29: Device download

If a download is made using the commissioning software, the device is automatically brought into this state. After the download has been completed, p0009 is automatically set to 0 (ready). It is not possible to manually set p0009 to this value.

p0009 = 30: Parameter reset

In order to bring the complete unit into the "first commissioning" state or to load the parameters saved using p0977, to start, p0009 must be set to this value. p0976 can then be changed to the required value.

p0009 = 50: OA application configuration

In this state, after the device has been commissioned for the first time, changes can be made for the individual drive objects regarding the activity (p4956) of the OA applications.

p0009 = 55: OA application installation

OA applications can be installed and/or uninstalled in this state.

p0009 = 101: Topology input

In this state, the DRIVE-CLiQ target topology can be entered using p9902 and p9903.

p0009 = 111: Insert drive object

This state allows a new drive object to be inserted using p9911.

p0009 = 112: Delete drive object

This state allows existing drive objects to be deleted using p9912 after the device has been commissioned for the first time.

p0009 = 113: Change drive object number

This state allows the drive object number of existing drive objects to be changed using p9913 after the device has been commissioned for the first time.

p0009 = 114: Change component number

This state allows the component number of existing components to be changed using p9914 after the device has been commissioned for the first time.

p0009 = 115: Parameter download

This state allows the complete device and drive commissioning using the parameter services.

p0009 = 117: Delete component

This state allows components to be deleted using p9917 after the device has been commissioned for the first time.

<b>p0010</b>			
<b>Infeed commissioning parameter filter / INF comm par_filt</b>			
B_INF	<b>Can be changed:</b> C2(1), T	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -

### p0010 Drive commissioning parameter filter / Drv comm. par\_filt

VECTOR_G	<b>Can be changed:</b> C2(1), T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000	<b>Access level:</b> 1 <b>Func. diagram:</b> 2800, 2846 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
----------	--	--	--

**Description:** Sets the parameter filter to commission a drive.

Setting this parameter filters out the parameters that can be written into in the various commissioning steps.

**Value:** 0: Ready  
1: Quick commissioning  
2: Power unit commissioning  
3: Motor commissioning  
4: Encoder commissioning  
5: Technological application/units  
15: Data sets  
17: Basic positioner commissioning  
25: Position control commissioning  
29: Only Siemens int  
30: Parameter reset  
95: Safety Integrated commissioning  
10000: Ready with immediate feedback signal

**Notice:** For p0010 = 10000 the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** The drive can only be powered up outside the drive commissioning (inverter enable). To realize this, this parameter must be set to 0.

By setting p3900 to a value other than 0, the quick commissioning is completed, and this parameter is automatically reset to 0.

Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1.

p0010 = 10000 corresponds to p0010 = 0. Unlike with p0010 = 0, the parameter modification is applied immediately and the calculations are made in the background. Further parameter modifications cannot be made while the calculations are being performed.

---

### p0011 BOP password entry (p0013) / BOP passw ent p13

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
---	---	--	---

**Description:** Sets the password for the Basic Operator Panel (BOP).

**Dependency:** Refer to: p0012, p0013

<b>p0012</b>	<b>BOP password acknowledgement (p0013) / BOP passw ackn p13</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Acknowledges the password for the Basic Operator Panel (BOP).		
<b>Dependency:</b>	Refer to: p0011, p0013		
<b>p0013[0...49]</b>	<b>BOP user-defined list / BOP list</b>		
All objects	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the required parameters to read and write via the Basic Operator Panel (BOP). Activation: 1. p0003 = 3 (expert). 2. p0013[0...49] = requested parameter number 3. If required, enter p0011 = password in order to prevent non-authorized de-activation. 4. p0016 = 1 --> activates the selected user-defined list. De-activation/change: 1. p0003 = 3 (expert). 2. If required, p0012 = p0011, in order to be authorized to change or de-activate the list. 3. If required p0013[0...49] = required parameter number. 4. p0016 = 1 --> activates the modified user-defined list. 5. p0003 = 0 --> de-activates the user-defined list.		
<b>Dependency:</b>	Refer to: p0009, p0011, p0012, p0976		
<b>Note:</b>	The following parameters can be read and written on the Control Unit drive object: - p0003 (access stage) - p0009 (device commissioning, parameter filter) - p0012 (BOP password acknowledgement (p0013)) The following applies for the user-defined list: - password protection is only available on the drive object Control Unit and is valid for all of the drive objects. - p0013 cannot be included in the user-defined list for all drive objects. - p0003, p0009, p0011, p0012, p0976 cannot, for the drive object Control Unit, be included in the user-defined list. - the user-defined list can be cleared and de-activated "restore factory setting". A value of 0 means: Entry is empty.		
<b>p0015</b>	<b>Macro drive object / Macro DO</b>		
B_INF, TM150, TM31, VECTOR_G	<b>Can be changed:</b> C2(1) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Commands <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 999999	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Runs the corresponding macro files. The selected macro file must be available on the memory card/device memory. Example: p0015 = 6 --> the macro file PM000006.ACX is run.		

<b>Dependency:</b>	Refer to: p0700, p1000, p1500, r8570
<b>Caution:</b>	When executing a specific macro, the corresponding programmed settings are made and become active.
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK_IBN group!
<b>Note:</b>	The macros in the specified directory are displayed in r8570. r8570 is not in the expert list of the commissioning software. Macros available as standard are described in the technical documentation of the particular product. The parameter is not influenced by setting the factory setting.

<b>Description:</b>	Displays the smoothed torque-generating actual current.		
<b>Dependency:</b>	Refer to: r0078		
<b>Note:</b>	SERVO: Smoothing time constant = 100 ms VECTOR: Smoothing time constant = 300 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The following applies for SERVO: The torque-generating current actual value is available smoothed (r0030 with 100 ms, r0078[1] with p0045) and unsmoothed (r0078[0]). The following applies for VECTOR: The torque-generating current actual value is available smoothed (r0030 with 300 ms) and unsmoothed (r0078).		
<b>r0031</b>	<b>Actual torque smoothed / M_act smooth</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [Nm]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 7_1 <b>Scaling:</b> p2003 <b>Max</b> - [Nm]	<b>Access level:</b> 2 <b>Func. diagram:</b> 5730, 6799 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [Nm]
<b>Description:</b>	Displays the smoothed torque actual value.		
<b>Dependency:</b>	Refer to: r0080		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The active current actual value is available smoothed (r0031) and unsmoothed (r0080).		
<b>r0032</b>	<b>CO: Active power actual value smoothed / P_actv_act smth</b>		
B_INF	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [kW]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 14_10 <b>Scaling:</b> r2004 <b>Max</b> - [kW]	<b>Access level:</b> 2 <b>Func. diagram:</b> 5730, 6799, 8750, 8850, 8950 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [kW]
<b>Description:</b>	Displays the smoothed actual value of the active power.		
<b>Dependency:</b>	Refer to: r0082		
<b>Notice:</b>	This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used. For Basic Line Modules of chassis format, the displayed value is invalid as these units do not have any current sensing.		
<b>Note:</b>	Significance for the drive: Power output at the motor shaft Significance for the infeed: Line power drawn For A_INF, B_INF and S_INF the following applies: The active power is available smoothed (r0032 with 300 ms) and unsmoothed (r0082). The following applies for SERVO: The active power is available smoothed (r0032 with 100 ms, r0082[1] with p0045) and unsmoothed (r0082[0]).		

For VECTOR and VECTORMV, the following applies:

The active power is available smoothed (r0032 with 100 ms) and unsmoothed (r0082).

<b>r0032</b>	<b>CO: Active power actual value smoothed / P_actv_act smth</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32  <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [kW]	<b>Calculated:</b> - <b>Dynamic index:</b> -  <b>Units group:</b> 14_10 <b>Scaling:</b> r2004 <b>Max</b> - [kW]	<b>Access level:</b> 2 <b>Func. diagram:</b> 5730, 6799, 8750, 8850, 8950 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [kW]
<b>Description:</b>	Displays the smoothed actual value of the active power.		
<b>Dependency:</b>	Refer to: r0082		
<b>Notice:</b>	This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used.		
<b>Note:</b>	Significance for the drive: Power output at the motor shaft Significance for the infeed: Line power drawn For A_INF, B_INF and S_INF the following applies: The active power is available smoothed (r0032 with 300 ms) and unsmoothed (r0082). The following applies for SERVO: The active power is available smoothed (r0032 with 100 ms, r0082[1] with p0045) and unsmoothed (r0082[0]). For VECTOR and VECTORMV, the following applies: The active power is available smoothed (r0032 with 100 ms) and unsmoothed (r0082).		
<b>r0033</b>	<b>Torque utilization smoothed / M_util smooth</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [%]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> - [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 8012 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [%]
<b>Description:</b>	Displays the smoothed torque utilization as a percentage. The torque utilization is obtained from the required smoothed torque in reference to the torque limit, scaled using p2196.		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque utilization is available smoothed (r0033) and unsmoothed (r0081). For M_set total (r0079) > 0, the following applies: - Required torque = M_set total - Actual torque limit = M_max upper effective (r1538) For M_set total (r0079) <= 0, the following applies: - Required torque = - M_set total - Actual torque limit = - M_max lower effective (r1539) For the actual torque limit = 0, the following applies: r0033 = 100 % For the actual torque limit < 0, the following applies: r0033 = 0 %		

<b>r0034</b>	<b>CO: Motor utilization / Motor utilization</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> - [%]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> - [%]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8017 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [%]
<b>Description:</b>	Displays the motor utilization from motor temperature model 1 (I2t) or 3.		
<b>Dependency:</b>	The motor utilization is only determined for permanent-magnet synchronous motors when the motor temperature model 1 (I2t) or 3 is activated. For motor temperature model 1 (I2t) (p0612.0 = 1), the following applies: - r0034 = (motor model temperature - 40 K) / (p0605 - 40 K) * 100 % For motor temperature model 3 (p0612.2 = 1), the following applies: - r0034 = (motor model temperature - p0613) / (p5390 - p0613) * 100 % Refer to: p0611, p0612, p0615		
<b>Notice:</b>	After the drive is switched on, the system starts to determine the motor temperature with an assumed model value. This means that the value for the motor utilization is only valid after a stabilization time.		
<b>Note:</b>	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. For r0034 = -200.0 %, the following applies: The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).		
<b>r0035</b>	<b>CO: Temperature input / Temp_input</b>		
B_INF	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 21_1 <b>Scaling:</b> p2006 <b>Max</b> - [°C]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8750 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [°C]
<b>Description:</b>	Displays the temperature currently measured at X21 (booksize) or X41 (chassis). For a BLM with internal Braking Module, a bimetallic sensor must be connected up to monitor the temperature of the braking resistor. The temperature sensor type is indicated using p0601 and cannot be changed for the existing internal Braking Module. Temperature within permissible limit values: r0035 = -50°C Temperature outside the permissible limit values: r0035 = 250°C		
<b>Dependency:</b>	Refer to: F06907, F06908		
<b>Notice:</b>	The function in r0192.11 must be available in order to obtain a correct display.		
<b>Note:</b>	For r0035 equal to -200.0 °C, the following applies: - "no sensor" selected in p0601! For r0035 equal to -300.0 °C, the following applies: - a KTY84 is selected in p0601 but is not connected! - the temperature display is not valid (temperature sensor error)!		
<b>r0035</b>	<b>CO: Motor temperature / Mot temp</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32  <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> -  <b>Units group:</b> 21_1 <b>Scaling:</b> p2006 <b>Max</b> - [°C]	<b>Access level:</b> 2 <b>Func. diagram:</b> 7008, 8016, 8017 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [°C]
<b>Description:</b>	Displays the actual temperature in the motor.		

**Note:** For r0035 not equal to -200.0 °C, the following applies:

- this temperature display is valid.
- a KTY sensor is connected.
- the thermal model for the induction motor is activated (p0612 bit 1 = 1 and temperature sensor de-activated: p0600 = 0 or p0601 = 0).

For r0035 equal to -200.0 °C, the following applies:

- this temperature display is not valid (temperature sensor error).
- A PTC sensor or bimetallic NC contact is connected.
- the temperature sensor of the synchronous motor is de-activated (p0600 = 0 or p0601 = 0).

<b>r0036</b>	<b>CO: Power unit overload I2t / PU overload I2t</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [%]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> - [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 8014 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [%]
<b>Description:</b>	Displays the power unit overload determined using the I2t calculation. A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.). If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed. In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.		
<b>Dependency:</b>	Refer to: p0290, p0294 Refer to: F30005		

<b>r0037[0...19]</b>	<b>CO: Power unit temperatures / PU temperatures</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 21_1 <b>Scaling:</b> p2006 <b>Max</b> - [°C]	<b>Access level:</b> 3 <b>Func. diagram:</b> 8014 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [°C]
<b>Description:</b>	Displays the temperatures in the power unit.		
<b>Index:</b>	[0] = Inverter, maximum value [1] = Depletion layer maximum value [2] = Rectifier maximum value [3] = Air intake [4] = Interior of power unit [5] = Inverter 1 [6] = Inverter 2 [7] = Inverter 3 [8] = Inverter 4 [9] = Inverter 5 [10] = Inverter 6 [11] = Rectifier 1 [12] = Rectifier 2 [13] = Depletion layer 1 [14] = Depletion layer 2 [15] = Depletion layer 3 [16] = Depletion layer 4 [17] = Depletion layer 5 [18] = Depletion layer 6 [19] = Cooling unit liquid intake		

**Note:** The value of -200 indicates that there is no measuring signal.  
r0037[0]: Maximum value of the inverter temperatures (r0037[5...10]).  
r0037[1]: Maximum value of the depletion layer temperatures (r0037[13...18]).  
r0037[2]: Maximum value of the rectifier temperatures (r0037[11...12]).  
The maximum value is the temperature of the hottest inverter, depletion layer, or rectifier.

---

**r0037[0...1] Control Unit temperature / CU temp**

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> p2006	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [°C]	- [°C]	- [°C]

**Description:** Displays the measured Control Unit temperature.  
An appropriate message is output when the permitted operating temperature is exceeded.

**Index:** [0] = Actual measured value  
[1] = Maximum measured value

**Dependency:** Refer to: A01009

**Note:** The value of -200 indicates that there is no measuring signal.

---

**r0038 Power factor smoothed / Cos phi smooth**

VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 6799, 8850, 8950
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the smoothed actual power factor.

**Notice:** For infeed units, the following applies:

For active powers < 25 % of the rated power, this does not provide any useful information.

**Note:** Smoothing time constant = 300 ms

The signal is not suitable as a process quantity and may only be used as a display quantity.

Meaning for motor:

- power factor of the basic fundamental signals at the converter output.

Meaning for infeed:

- Power factor at the connection point (r3470, r3471)

---

**r0039[0...2] Energy display / Energy displ**

29	Cooling unit ready signal missing	Yes	No	-
30	Speed controller inhibited	Yes	No	-
31	Jog setpoint active	Yes	No	-

**Dependency:**

Refer to: r0002

**Note:** The value r0046 = 0 indicates that all enable signals for this drive are present.

Bit 00 = 1 (enable signal missing), if:

- the signal source in p0840 is a 0 signal.
- there is a "switching on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 02 = 1 (enable signal missing), if:

- the signal source in p0848 or p0849 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:

- the signal source in p0852 is a 0 signal.

Bit 04 = 1 (armature short-circuit active), if:

- the signal source in p1230 has a 1 signal

Bit 05, Bit 06: Being prepared

Bit 08 = 1 (enable signal missing), if:

- safety functions have been enabled and STO is active.

STO selected via terminals:

- the pulse enable via terminal EP is missing (booksize: X21, chassis: X41), or the signal source in p9620 is for a 0 signal.

STO selected via PROFIsafe or TM54F:

- A safety-relevant signal is present with a STOP A response.

Bit 09 = 1 (enable signal missing), if:

- the signal source in p0864 is a 0 signal.

Bit 10 = 1 (enable signal missing), if:

- the signal source in p1140 is a 0 signal.

Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:

- the signal source in p1141 is a 0 signal.
- the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.

Bit 12 = 1 (enable signal missing), if:

- the signal source in p1142 is a 0 signal.
- When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:

- commissioning mode is selected (p0009 > 0 or p0010 > 0).
- there is an OFF2 fault response.
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).

Bit 18 = 1 (enable signal missing), if:

- OFF3 has still not been completed or an OFF3 fault response is present.

Bit 19 = 1 (internal pulse enable missing), if:

- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.

Bit 20 = 1 (internal armature short-circuit active), if:

- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Bit 21 = 1 (enable signal missing), if:

The pulses have been enabled and the speed setpoint has still not been enabled, because:

- the holding brake opening time (p1216) has still not expired.
- the motor has still not been magnetized (induction motor).
- the encoder has not been calibrated (U/f vector and synchronous motor)

Bit 22: Being prepared

Bit 26 = 1 (enable signal missing), if:

- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).

- All power units of a parallel connection are deactivated (p0125, p0895).
- Bit 27 = 1 (enable signal missing), if:
  - de-magnetizing has still not been completed (only for vector).
- Bit 28 = 1 (enable signal missing), if:
  - the holding brake is closed or has still not been opened.
- Bit 29 = 1 (enable signal missing), if:
  - the cooling unit ready signal via BI: p0266[1] missing.
- Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:
  - A 0 signal is available via BI: p0856.
  - the function generator with current input is active.
  - the measuring function "current controller reference frequency characteristic" is active.
  - the pole position identification is active.
  - motor data identification is active (only certain steps).
- Bit 31 = 1 (enable signal missing), if:
  - the speed setpoint from jog 1 or 2 is entered.

<b>Dependency:</b>	Refer to: r0098, p0099 Refer to: A01330		
<b>Note:</b>	For p0097 = 0, p0099 is automatically set to the factory setting. The possible settings are dependent upon the device type.		

<b>r0098[0...5]</b>	<b>Actual device topology / Device_act topo</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Topology	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> -
<b>Description:</b>	Displays the automatically detected actual device topology in coded form.		
<b>Index:</b>	[0] = DRIVE-CLiQ socket X100 [1] = DRIVE-CLiQ socket X101 [2] = DRIVE-CLiQ socket X102 [3] = DRIVE-CLiQ socket X103 [4] = DRIVE-CLiQ socket X104 [5] = DRIVE-CLiQ socket X105		
<b>Dependency:</b>	Refer to: p0097, p0099		
<b>Note:</b>	Topology coding: abcd efgh hex a = number of Active Line Modules b = number of Motor Modules c = number of motors d = number of encoders (or the line supply voltage sensing for Active Line Modules) e = number of additional encoders (or the line supply voltage sensing for Active Line Modules) f = number of Terminal Modules g = number of Terminal Boards h = reserved if the value 0 is displayed in all indices, then components are not detected via DRIVE-CLiQ. If a value F hex occurs at a position of the coding (abcd efgh hex), then an overflow has occurred.		

<b>p0099[0...5]</b>	<b>Device target topology / Device_target topo</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> C1(1) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Topology <b>Not for motor type:</b> - <b>Min</b> 0000 hex	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> FFFF FFFF hex	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0000 hex
<b>Description:</b>	Sets the device target topology in coded form (refer to r0098). The setting is made during commissioning. De-activated or non-available components are also counted		
<b>Index:</b>	[0] = DRIVE-CLiQ socket X100 [1] = DRIVE-CLiQ socket X101 [2] = DRIVE-CLiQ socket X102 [3] = DRIVE-CLiQ socket X103 [4] = DRIVE-CLiQ socket X104 [5] = DRIVE-CLiQ socket X105		
<b>Dependency:</b>	The parameter can only be written into for p0097 = 0. To perform an automatic device configuration run, an index of the device target topology must be set to the value of the device actual topology in r0098 for acknowledgement. An index of the device actual topology with a value other than 0 must be selected. Refer to: p0097, r0098 Refer to: A01330		
<b>Note:</b>	The parameter can only be set to the values 0, the value of the actual device topology, the value of the actual device target topology and FFFFFFFF hex. If the value 0 is displayed in all of the indices, then the system has still not been commissioned. The value FFFFFFFF hex indicates that the topology was not generated by the automatic device configuration but was commissioned using the commissioning software (e.g. using parameter download).		
<b>p0100</b>	<b>IEC/NEMA mot stds / IEC/NEMA mot stds</b>		
VECTOR_G	<b>Can be changed:</b> C2(1) <b>Data type:</b> Integer16 <b>P-Group:</b> Converter <b>Not for motor type:</b> FEM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Defines whether the motor and drive converter power settings (e.g. rated motor power, p0307) are expressed in [kW] or [hp]. Depending on the selection, the rated motor frequency (p0310) is either set to 50 Hz or 60 Hz. For p0100 = 0, the following applies: The power factor (p0308) should be parameterized. For p0100 = 1, the following applies: The efficiency (p0309) should be parameterized.		
<b>Value:</b>	0: IEC-Motor (50 Hz, SI units) 1: NEMA motor (60 Hz, US units)		
<b>Dependency:</b>	If p0100 is changed, all of the rated motor parameters are reset. Only then are possible unit changeovers made. The units of all motor parameters are changed that are involved in the selection of IEC or NEMA (e.g. r0206, p0307, p0316, r0333, r0334, p0341, p0344, r1493, r1969). Refer to: r0206, p0210, p0300, p0304, p0305, p0307, p0308, p0309, p0310, p0311, p0314, p0320, p0322, p0323, p0335, r0336, r0337, p1800		
<b>Note:</b>	The parameter can only be changed for vector control (p0107). The parameter value is not reset when the factory setting is restored (p0010 = 30, p0970).

	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	2	1
<b>Description:</b>	Setting to activate/de-activate a drive object.		
<b>Value:</b>	0: De-activate drive object 1: Activate drive object 2: Drive object, de-activate and not present		
<b>Recommend.:</b>	After inserting all of the components of a drive object, before activating, first wait for Alarm A01316.		
<b>Dependency:</b>	Refer to: r0106 Refer to: A01314, A01316		
<b>Caution:</b>	When activating drive objects with the safety functions enabled, the following applies: After reactivating, a warm restart (p0009 = 30, p0976 = 2, 3) or POWER ON should be carried out.		
<b>Notice:</b>	The following applies when activating: If components are inserted for the first time and the appropriate drive object is activated, then the drive system is automatically booted. To do this, the pulses of all of the drive objects must be suppressed.		
<b>Note:</b>	Re value = 0, 2: When a drive object is deactivated it no longer outputs any errors.		

If value = 0:

All components of the drive object were completely commissioned and are deactivated using this value. They can be removed from the DRIVE-CLiQ without any error.

If value = 1:

All components of the drive object must be available for error-free operation.

If value = 2:

Components of a drive object in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the components are marked to be bypassed in the DRIVE-CLiQ line.

For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

**p0105****Activate/de-activate drive object / DO act/deact**

**Description:**

The function module of an existing drive object is entered into each index (see p0101, p0107).

The following bits are available for the Control Unit (Index 0):

Bit 18: Free function blocks

Bit 29: CAN

Bit 30: COMM BOARD

Bit 31: PROFINET

For all other drive objects (Index > 0), the significance of the bits should be taken from the display parameters r0108 of the drive object.

<b>Description:</b>	Pre-assignment of the sampling times in p0115. The clock cycles for the current controller / speed controller / flux controller / setpoint channel / position controller / positioning / technology controller are pre-assigned as follows:		

SINAMICS S, servo drive:

p0112 = 1: 250 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs (for chassis units)

p0112 = 2: 125 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs

p0112 = 3: 125 / 125 / 125 / 4000 / 1000 / 4000 / 4000 µs

p0112 = 4: 62.5 / 62.5 / 62.5 / 1000 / 1000 / 2000 / 1000 µs

p0112 = 5: 31.25 / 31.25 / 31.25 / 1000 / 1000 / 2000 / 1000 µs

SINAMICS S, Active Infeed (p0112 = 1 not for p0092 = 1):

p0112 = 1: 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)

p0112 = 2: 250 / - / - / 2000 µs (pre-setting for the rated pulse frequency = 4.0 kHz)

p0112 = 3: 125 / - / - / 2000 µs

p0112 = 4: 125 / - / - / 1000 µs

p0112 = 5: 125 / - / - / 500 µs

SINAMICS S, Smart Infeed (p0112 = 1 not for p0092 = 1):

p0112 = 1: 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)

p0112 = 2: 250 / - / - / 2000 µs (pre-setting for the rated pulse frequency = 4.0 kHz)

p0112 = 3: 250 / - / - / 2000 µs

p0112 = 4: 250 / - / - / 1000 µs

p0112 = 5: Not possible

SINAMICS S, Basic Infeed, booksize:

p0112 = 4: 250 / - / - / 2000 µs

SINAMICS S, Basic Infeed, chassis:

p0112 = 1: 2000 / - / - / 2000 µs

p0112 = 2: 2000 / - / - / 2000 µs (pre-setting)

p0112 = 3: 2000 / - / - / 2000 µs

p0112 = 4: Not possible

p0112 = 5: Not possible

SINAMICS S/G, vector drive (p0112 = 1 not for p0092 = 1 and not for PM340):

p0112 = 1: 400 / 1600 / 1600 / 1600 / 3200 / 3200 / 3200 µs (for rated pulse frequency = 1.25, 2.5 kHz)

p0112 = 2: 250 / 1000 / 2000 / 1000 / 2000 / 4000 / 4000 µs

p0112 = 3: 250 / 1000 / 1000 / 1000 / 2000 / 4000 / 4000 µs (for rated pulse frequency = 2.0, 4.0 kHz)

SINAMICS S, vector drive:

p0112 = 4: 250 / 500 / 1000 / 500 / 1000 / 2000 / 2000 µs

p0112 = 5: 250 / 250 / 1000 / 500 / 1000 / 2000 / 1000 µs

**Value:**

- 0: Expert
- 1: xLow
- 2: Low
- 3: Standard
- 4: High
- 5: xHigh

**Recommend.:** When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.

**Dependency:** It is prohibited to select a parameter value from p0112 if the associated current controller clock cycle cannot set (e.g. p0112 = 1 is not possible for a vector drive and PM340 power unit).  
If, for a servo drive, p112 = 5 is set, then the pulse frequency p1800 is preassigned 8 kHz. For D410-2 and vector drive, the current controller sampling time can only be permanently changed for p0112 = 0.

Refer to: p0092

**Note:** For p0112 = 0 (expert) the individual sampling times in p0115 can be adjusted.  
The setting p0112 = 1 cannot be set for a vector drive with power unit type PM340 (refer to r0203).

<b>Value:</b>	0: Expert 1: xLow 2: Low 3: Standard		
<b>Recommend.:</b>	When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.		
<b>Dependency:</b>	It is prohibited to select a parameter value from p0112 if the associated current controller clock cycle cannot set (e.g. p0112 = 1 is not possible for a vector drive and PM340 power unit).		

If, for a servo drive, p112 = 5 is set, then the pulse frequency p1800 is preassigned 8 kHz. For D410-2 and vector drive, the current controller sampling time can only be permanently changed for p0112 = 0.

Refer to: p0092

**Note:** For p0112 = 0 (expert) the individual sampling times in p0115 can be adjusted.  
The setting p0112 = 1 cannot be set for a vector drive with power unit type PM340 (refer to r0203).

<b>p0113</b>	<b>Minimum pulse frequency, selection / f_puls min sel</b>		
VECTOR_G	<b>Can be changed:</b> C1(3)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 1.000 [kHz]	<b>Max</b> 2.000 [kHz]	<b>Factory setting</b> 2.000 [kHz]
<b>Description:</b>	The current controller sampling time (p0115[0]) is pre-assigned by selecting the minimum pulse frequency.		
<b>Dependency:</b>	The parameter can only be changed with p0112 = 0 (expert). For isochronous operation (p0092 = 1) the parameter can only be set so that a current controller clock cycle of 125 µs is obtained as an integer number. The required pulse frequency can be set in p1800 after commissioning (p0009 = p0010 = 0). Refer to: p0112, r0114, p0115, p1800		
<b>Note:</b>	The current controller sampling time (p0115[0]) is set to the inverse value of twice the minimum pulse frequency. For p0113 = 1.0 kHz, p0115[0] = 500 µs is set, for p0113 = 2.0 kHz, p0115[0] = 250 µs is set. The current controller sampling time (p0115[0]), calculated from the pulse frequency, is set in a grid of 1.25 µs. For a power unit type PM340 (refer to r0203), only the values 1.0 and 2.0 kHz can be set. 1.0 kHz can be set in order to achieve a current controller clock cycle of 500µs. However, in this case, the minimum pulse frequency p1800 is limited to 2 kHz.		

<b>r0114[0...9]</b>	<b>Minimum pulse frequency, recommended / f_puls min recom</b>		
VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [µs]	16000.00 [µs]	[0] 125.00 [µs]
			[1] 125.00 [µs]
			[2] 125.00 [µs]
			[3] 4000.00 [µs]
			[4] 1000.00 [µs]
			[5] 4000.00 [µs]
			[6] 4000.00 [µs]
<b>Description:</b>	Sets the sampling times for the control loops. The default setting is made using p0112 and can only be individually changed for p0112 = 0 (expert).		
<b>Recommend.:</b>	When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.		
<b>Index:</b>	[0] = Current controller [1] = Speed controller [2] = Flux controller [3] = Setpoint channel [4] = Pos controller [5] = Positioning [6] = Technology controller		
<b>Dependency:</b>	The sampling times can only be separately set if p0112 is 0 (expert). If a sampling time is modified in the expert mode, then all of the sampling times with higher indices are automatically changed in the same ratio as the sampling time itself was changed. Slower time slices are only taken if the calculated sampling time is also permitted. Upper limit is 8 ms.  Higher-level controls must be calculated in integral ratios to lower-level controls (e.g. $p0115[1] = N * p0115[0]$ ; where N is an integer number). The sampling time of the speed controller (p0115[1]) can have as a maximum a value of 800% of the current controller sampling time (p0115[0]).  For servo drives, the maximum sampling time of the current controller is 250 µs and for vector drives, 500 µs.  The sampling times for setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) must have at least 2x the value of the current controller sampling time (p0115[0]).  Refer to: r0110, r0111, p0112		
<b>Note:</b>	For function modules that can be activated (e.g. technology controller), the parameters values are pre-assigned.  For the Active Line Module (ALM) and Smart Line Module (SLM), the current and DC link voltage controllers operate with the same sampling time. For ALM/SLM the maximum current controller clock cycle is 400 µs.  For the Basic Line Module (BLM), the DC link voltage measurement operates in the current controller sampling time.  For BLM booksize, only the current controller sampling time of 250 µs is permitted. For BLM chassis, only the current controller sampling time of 2000 µs is permitted.  For power unit type PM340 (r0203), only current controller sampling times of 62.5 µs, 125 µs, 250 µs and 500 µs can be set. The maximum current controller clock cycle for servo drives and the minimum current controller clock cycle for vector drives is 250 µs.  If sampling times in p0115 are individually changed for p0112 = 0 (expert) then it must always be observed that the selected sampling times of the setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) are always greater than or equal to twice the current controller sampling time (p0115[0]).		

<b>p0115[0]</b>	<b>Sampling time for supplementary functions / t_samp suppl_fct</b>

	<b>Min</b> 0.00 [µs]	<b>Max</b> 16000.00 [µs]	<b>Factory setting</b> [0] 250.00 [µs] [1] 1000.00 [µs] [2] 1000.00 [µs] [3] 1000.00 [µs] [4] 2000.00 [µs] [5] 4000.00 [µs] [6] 4000.00 [µs]
<b>Description:</b>	Sets the sampling times for the control loops. The default setting is made using p0112 and can only be individually changed for p0112 = 0 (expert).		
<b>Recommend.:</b>	When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.		

When adjusting the current controller sampling time, it is recommended to use values that are an integer multiple of 6.25 µs. The sampling times of analog or digital inputs/outputs (see p0799, p4099) should be set to an integer multiple of the current controller sampling time.

If the current controller sampling time is to be reduced with respect to the default setting (e.g. < 250 µs), then it is recommended that the motor data identification (standstill measurement) is executed beforehand, in order to avoid a thermal overload of the power unit as a result of high pulse frequencies (p1800).

**Index:**  
 [0] = Current controller  
 [1] = Speed controller  
 [2] = Flux controller  
 [3] = Setpoint channel  
 [4] = Pos controller  
 [5] = Positioning  
 [6] = Technology controller

**Dependency:** Depending on the number and type of vector drives, the sampling times are preset differently.  
 The sampling times can only be separately set if p0112 is 0 (expert). If a sampling time is modified in the expert mode, then all of the sampling times with higher indices are automatically changed in the same ratio as the sampling time itself was changed. Slower time slices are only taken if the calculated sampling time is also permitted. Upper limit is 8 ms.  
 Higher-level controls must be calculated in integral ratios to lower-level controls (e.g. p0115[1] = N \* p0115[0]; where N is an integer number). The sampling time of the speed controller (p0115[1]) can have as a maximum a value of 800% of the current controller sampling time (p0115[0]).  
 The sampling times for setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) must have at least 2x the value of the current controller sampling time (p0115[0]).  
 The sampling time of the current controller p0115[0] and pulse frequency p1800 are checked at each parameter download, and when necessary changed, if, for p0092 = 1, the current controller clock cycle is not an integral multiple of 125 µs or if p0112 is set > 1. For p0092 = 0, the check with p0112 = 0 (= expert) can be deactivated.  
 Refer to: r0110, r0111, p0112

**Note:** For function modules that can be activated (e.g. technology controller), the parameters values are pre-assigned.  
 For power unit type PM340 (r0203), only current controller sampling times of 250 µs or 500 µs can be set. The minimum current controller clock cycle is otherwise 125 µs (SINAMICS G: 250 µs), the maximum current controller clock cycle is 500 µs. The minimum speed controller clock cycle for SINAMICS G is 1 ms.  
 Current controller clock cycles less than 250 µs are restricted by the number of drives or by the number of power units connected in parallel (also see F01340).  
 For chassis power units connected in parallel, it is recommended to connect the DRIVE-CLiQ cables (partially) in parallel between the Control Unit and the individual Motor Modules.  
 For D410-2, the current controller sampling times can only be permanently changed with p0112 = 0 (e.g. to 250 µs).

r0116[0...1]		Drive object clock cycle recommended / DO_clock recom

<b>Description:</b>	Detection of the main components of the drive object selected via the index.		

<b>p0125[0...n]</b>		<b>Activate/de-activate power unit components / PU_comp act/deact</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> C1(4), T <b>Data type:</b> Integer16 <b>P-Group:</b> Data sets <b>Not for motor type:</b> - <b>Min</b> 0 <b>Max</b> 2	<b>Calculated:</b> - <b>Dynamic index:</b> PDS, p0120 <b>Units group:</b> - <b>Scaling:</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1	
<b>Description:</b>	Setting to activate/de-activate a power unit component.			
<b>Value:</b>	0: De-activate component 1: Activate component 2: Component, de-activate and not present			
<b>Recommend.:</b>	After inserting a component, before activating, first wait for Alarm A01317.			
<b>Dependency:</b>	Refer to: r0126 Refer to: A01314, A01317			
<b>Caution:</b> 	For a parallel connection, the following applies: When deactivating individual power units using p0125, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.			
<b>Caution:</b>	It is not permissible to de-activate drive objects with safety functions enabled.			
<b>Note:</b>	The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. For units connected in parallel, when one of the power units is de-activated, then the enable in p7001 is withdrawn. Re value = 0, 2: When a component is deactivated it no longer outputs any errors. If value = 0: The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error. If value = 1: The component must be available for error-free operation. If value = 2: A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the component is marked to be bypassed in the DRIVE-CLiQ line. For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

<b>Description:</b>	This parameter is used to assign the encoder data set to an encoder evaluation (e.g. SMC). This unique component number is assigned when parameterizing the topology. Only component numbers can be entered into this parameter that correspond to an encoder evaluation.		
<b>Note:</b>	If the encoder evaluation and encoder are integrated (motor with DRIVE-CLiQ), then their component numbers are identical.  For an SMC, different component numbers are assigned for the SMC (p0141) and the (actual) encoder (p0142).		

<b>p0142[0...n]</b>	<b>Encoder component number / Encoder comp_no</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C1(4) <b>Data type:</b> Unsigned8 <b>P-Group:</b> Data sets <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 199	<b>Access level:</b> 3 <b>Func. diagram:</b> 4704 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	This parameter is used to assign the encoder data set to an encoder. This assignment is made using the unique component number that was assigned when parameterizing the topology. Only component numbers can be entered into this parameter that correspond to an encoder.		
<b>Note:</b>	If the encoder evaluation and encoder are integrated (motor with DRIVE-CLiQ), then their component numbers are identical. For an SMC, different component numbers are assigned for the SMC (p0141) and the (actual) encoder (p0142).		
<b>p0144[0...n]</b>	<b>Sensor Module detection via LED / SM detection LED</b>		
ENC, VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned8 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Detects the Sensor Module assigned to this drive and data set.		
<b>Note:</b>	While p0144 = 1, the READY LED flashes green/orange or red/orange with 2 Hz at the appropriate Sensor Module.		
<b>p0145[0...n]</b>	<b>Activate/de-activate encoder interface / Enc_intf act/deact</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C1(4), U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Data sets <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Setting to activate/de-activate an encoder interface (Sensor Module).		
<b>Value:</b>	0: De-activate component 1: Activate component 2: Component, de-activate and not present		
<b>Recommend.:</b>	After inserting a component, before activating, first wait for Alarm A01317.		
<b>Dependency:</b>	Refer to: r0146 Refer to: A01314, A01317		
<b>Note:</b>	The de-activation of an encoder interface corresponds to the "parking encoder" function and has the same effect. The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. With the encoder interface for encoder 1 (motor encoder), the relevant drive object for writing the parameter must be in the "Ready for operation" state. With the encoder interface for encoders 2 and 3, the parameter can also be written during operation. Re value = 0, 2: When a component is deactivated it no longer outputs any errors. If value = 0: The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error. If value = 1: The component must be available for error-free operation.		

If value = 2:

A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start.

For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the properties supported by the power unit firmware.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Edge modulation possible	Yes	No	-
	01	Free telegram can be selected	Yes	No	-
	02	Smart mode possible for Active Line Module	Yes	No	-
	03	Safety Integrated possible for VECTOR	Yes	No	-
	06	Liquid cooling	Yes	No	-
	07	SERVO pulse frequency changeover, DDS-dependent	Yes	No	-
	08	Simulation mode possible	Yes	No	-
	09	Internal armature short-circuit possible	Yes	No	-
	10	Autonomous internal armature short-circuit possible	Yes	No	-
	11	Infeed temperature inputs X21.1/2	Yes	No	-
	12	Integral scaled to half the gating unit clock cycle freq.	Yes	No	-
	13	Filtering thermal power unit current limit possible	Yes	No	-
	14	DC link compensation possible in power unit	Yes	No	-
	15	PT100 temperature evaluation possible	Yes	No	-
	16	Gating unit with pulse frequency wobulation possible	Yes	No	-
	17	Compound braking possible	Yes	No	-
	18	Extended voltage range possible	Yes	No	-
	19	Gating unit available with current limitation control	Yes	No	-
	20	Component status possible	Yes	No	-
	21	Temperature evaluation via Motor Module / CU terminals possible	Yes	No	-
	22	Reduced device supply voltage possible	Yes	No	-
	23	Current measurement oversampling available	Yes	No	-
	24	Parking keeping the relevant data is available	Yes	No	-
	25	Internal fan operating hours counter available	Yes	No	-
	26	Software gating unit in the CU is supported	Yes	No	-
	27	Current controller dynamics higher	Yes	No	-

**Notice:** This information represents the characteristics/features of the power unit firmware. It does not provide information/data about the characteristics/features of the hardware (e.g. bit 06 = 1 means that although the firmware supports "liquid cooling", a power unit with liquid cooling does not have to be used).

**Note:** Re bit 09:  
The Motor Module supports the internal armature short-circuit. The function is internally required for voltage protection (p1231 = 3).  
Re bit 10:  
The Motor Module supports the autonomous internal voltage protection.  
If the "internal voltage protection" function is activated (p1231 = 3) the Motor Module decides autonomously - using the DC link voltage - as to whether the short-circuit is activated.  
Re bit 23:  
The component supports the detection of current actual values (and the detection of valve close durations) with double clocking and phase shift.

<b>Description:</b>	Displays the unique code number of the power unit.		
<b>Note:</b>	r0200 = p0201: No power unit found For parallel circuit configurations, the parameter index is assigned to a power unit.		
<b>p0201[0...n]</b>	<b>Power unit code number / PU code no</b>		
B_INF	<b>Can be changed:</b> C2(2) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Converter <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> PDS, p0120 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the actual code number from r0200 to acknowledge the power unit being used. When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.		
<b>Dependency:</b>	Refer to: F07815		
<b>Note:</b>	The parameter is used to identify when the drive is being commissioned for the first time. The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2). For parallel circuit configurations, the parameter index is assigned to a power unit.		

<b>p0201[0...n]</b>	<b>Power unit code number / PU code no</b>		
VECTOR_G	<b>Can be changed:</b> C2(2) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Converter <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> PDS, p0120 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the actual code number from r0200 to acknowledge the power unit being used. When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.		
<b>Dependency:</b>	Refer to: F07815		
<b>Notice:</b>	When p0201 = 10000, the rated power unit data is reloaded and dependent parameters are set (e.g. p0205, p0210, p0230, p0857, p1800). p0201 is then automatically assigned the value of r0200 if the code number of the power unit could be read. A warm start must be performed after this procedure (automatically if necessary).		
<b>Note:</b>	The parameter is used to identify when the drive is being commissioned for the first time. The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2). However, if the comparator in p9906 or p9908 is at 2 (low) or 3 (minimum), the power unit commissioning is automatically set to p0201 = r0200 upon exiting. When the code number is changed, the connection voltage (p0210) is checked and, if necessary, adjusted. For parallel circuit configurations, the parameter index is assigned to a power unit.

### p0205 Power unit application / PU application

VECTOR_G	<b>Can be changed:</b> C2(1, 2)	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Converter	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	7	6

**Description:** Overloading the load duty cycles applies under the prerequisite that before and after the overload, the drive converter is operated with its base load current - in this case, a load duty cycle of 300 s is used as basis.  
For booksize drive units, the following applies:  
Only the setting p0205 = 0 can be selected. In this particular case, the base load current has a load duty cycle of 150 % for 60 s and 176 % for 30 s.  
For chassis units, the following applies:  
The base load current for a low overload condition is based on a load duty cycle 110 % for 60 s and 150 % for 10 s.  
The base load current for a high overload condition is based on a load duty cycle 150 % for 60 s and 160 % for 10 s.

**Value:** 0: Load duty cycle with high overload for vector drives  
1: Load duty cycle with low overload for vector drives  
6: S1 duty cycle for servo drives (feed drive)  
7: S6 duty cycle for servo drives (spindle drive)

**Note:** When the parameter is changed, all of the motor parameters and the control mode are pre-assigned according to the selected application.  
The parameter has no influence when calculating the thermal overload.  
p0205 can only be changed to the settings that are saved in the power unit EEPROM.  
The parameter value is not reset when the factory setting is restored (see p0010 = 30, p0970).

### r0206[0...4] Rated power unit power / PU P<sub>rated</sub>

**p0210      Drive unit line supply voltage / V<sub>connect</sub>**

B_INF	<b>Can be changed:</b> C2(1)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8760
	<b>P-Group:</b> Converter	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	70 [Vrms]	1000 [Vrms]	400 [Vrms]
<b>Description:</b>	Sets the drive unit supply voltage (3-ph. AC).		

	The value corresponds to the rms value of the phase-to-phase rated line supply voltage.
<b>Dependency:</b>	The parameter can be reduced to p0210 = 70 V if p0212.0 is set.
<b>Caution:</b>	If the line supply voltage is higher than the entered value, the Vdc controller may be automatically de-activated in some cases to prevent the motor from accelerating. In this case, an appropriate alarm is output.
<b>Notice:</b>	When connected to 3-ph. 230 V AC (only booksize units) the following must be observed: <ul style="list-style-type: none"> <li>- the undervoltage and overvoltage limits change (r0296, r0297).</li> <li>- when using the internal braking chopper of Basic Line Modules (20 or 40 kW) the threshold when the braking chopper becomes active is reduced to 385 V. When using an external braking chopper, it must be ensured that a suitable activation threshold is used.</li> <li>- all of the components connected to this DC link must also be adapted to the low line supply voltage. It is especially important that the rated DC voltage of all of the drives connected to this DC link is set with p0210 (e.g. p0210(SERVO) = 1.35 x p0210(B_INF) = 310 V).</li> <li>- it is not possible to use a Control Supply Module (CSM) to generate a 24 V supply from the DC link, as the minimum continuous DC link voltage should not be below 430 V.</li> </ul>
<b>Note:</b>	The supply voltage range depends on the voltage class of the power unit. <p>400 V chassis units: 380 V ≤ p0210 ≤ 480 V</p> <p>690 V chassis units: 500 V ≤ p0210 ≤ 690 V</p> <p>400 V booksize units can also be connected to 3-ph. 230 V AC:</p> <p>400 V booksize units: 180 V ≤ p0210 ≤ 480 V</p> <p>A reduced supply voltage up to 70 V is possible if p0212.0 = 1 has been set.</p>

p0210	Drive unit line supply voltage / V_connect		
VECTOR_G	Can be changed: C2(2), T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dynamic index: -	Func. diagram: -
	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 1 [V]	Max 63000 [V]	Factory setting 600 [V]
Description:	Sets the drive unit supply voltage. AC/AC unit: The rms value of the phase-to-phase line supply voltage should be entered. DC/AC unit: The rated DC voltage of the connection busbar should be entered.		
Dependency:	Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0. The switch-in thresholds of the Vdc_max controller are then directly determined using p0210. The parameter can be reduced to p0210 = 100 V if p0212.0 = 1 has been set. Refer to: p0212		
Caution:	If the line supply voltage is higher than the entered value, the Vdc controller may be automatically de-activated in some cases to prevent the motor from accelerating. In this case, an appropriate alarm is output.		
Note:	Setting ranges for p0210 as a function of the rated power unit voltage: U Rated = 400 V: - p0210 = 380 ... 480 V (AC/AC), 510 ... 720 V (DC/AC) U Rated = 500 V: - p0210 = 500 ... 600 V (AC/AC), 675 ... 900 V (DC/AC) U Rated = 660 ... 690 V: - p0210 = 660 ... 690 V (AC/AC), 890 ... 1035 V (DC/AC) U Rated = 500 ... 690 V: - p0210 = 500 ... 690 V (AC/AC), 675 ... 1035 V (DC/AC) The pre-charging switch-in threshold for the DC link voltage (Vdc) is calculated from p0210: Vdc_pre = p0210 * 0.82 * 1.35 (AC/AC) Vdc_pre = p0210 * 0.82 (DC/AC) The undervoltage thresholds for the DC link voltage (Vdc) are calculated from p0210 as a function of the rated power unit voltage: U Rated = 400 V: - U_min = p0210 * 0.78 (AC/AC) > 330 V, p0210 * 0.60 (DC/AC) > 380 V		

U<sub>rated</sub> = 500 V:

- U<sub>min</sub> = p0210 \* 0.76 (AC/AC) > 410 V

U<sub>rated</sub> = 660 ... 690 V:

- U<sub>min</sub> = p0210 \* 0.82 (AC/AC) > 565 V, p0210 \* 0.63 (DC/AC) > 650 V

U<sub>rated</sub> = 500 ... 690 V:

- U<sub>min</sub> = p0210 \* 0.82 (AC/AC) > 420 V, p0210 \* 0.63 (DC/AC) > 480 V

**p0212****Power unit configuration / PU config**

-

02   Supply voltage tolerance range extended

Yes

No

-

**Dependency:**

Re bit 00:

Reduced supply voltages are only possible on booksize power units.

Bit 0 = 1 can only be set if r0192.22 = 1.

Refer to: r0192, p0210

**Caution:**

Re bit 00:

Working with reduced input voltages de-activates undervoltage detection.

Re bit 03:

If the automatic setting of the V<sub>dc</sub> max limit is deactivated, then all of the components connected to the DC link must be suitable for the maximum DC link voltage of the power unit (e.g. 820 V for 400 V units).**Note:**

Re bit 00 = 0:

It is not possible to reduce the supply voltage in p0210.

Re bit 00 = 1 (only for B\_INF):

With this setting the supply voltage in p0210 can be reduced to 70 V. Bit 0 = 1 can only be set for booksize power units with a rated power of up to 40 kW.

**p0212****Power unit configuration / PU config**

No

Yes

-

**Dependency:**

Re bit 00:

Reduced supply voltages are only possible for booksize and chassis power units (DC/AC).

Bit 0 = 1 can only be set if r0192.22 = 1.

Re bit 01 = 1:

The external pre-charging setting only affects the DC/AC power units.

Re bit 03 = 1:

The automatic adaptation (reduction) of the V<sub>dc</sub> max limit is deactivated (only for chassis power units). Bit 3 only has an effect, if bit 0 is simultaneously set.

Refer to: r0192, p0210

**Caution:**

Re bit 00:

Working with reduced input voltages de-activates undervoltage detection.

Re bit 03:

If the automatic setting of the Vdc max limit is deactivated, then all of the components connected to the DC link must be suitable for the maximum DC link voltage of the power unit (e.g. 820 V for 400 V units).

**Note:**

Re bit 00 = 0:

It is not possible to reduce the supply voltage in p0210.

Re bit 00 = 1:

With this setting the supply voltage in p0210 can be reduced to 100 V.

Booksize PU: only for operating mode p1300 = 19

Chassis PU: only for operating mode p1300 > 19 and closed-loop DC voltage control

Re bit 01 = 0:

There is no external pre-charging of the DC/AC Motor Modules. The pre-charging monitoring is bypassed.

Re bit 01 = 1:

There is external pre-charging of the DC/AC Motor Modules. The pre-charging monitoring is calculated.

Re bit 03 = 0:

The DC link voltage limit is calculated from p0210.

Re bit 03 = 1:

The DC link voltage limit is set to the maximum value of the power unit.

**p0230**

**Drive filter type, motor side / Drv filt type mot**

VECTOR\_G

**Can be changed:** C2(1, 2)

**Calculated:** -

**Access level:** 1

**Data type:** Integer16

**Dynamic index:** -

**Func. diagram:** -

**P-Group:** Converter

**Units group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

4

0

**Description:**

Sets the type of the filter at the motor side.

**Value:**

- 0: No filter
- 1: Motor reactor
- 2: dv/dt filter
- 3: Sine-wave filter, Siemens
- 4: Sine-wave filter, third-party

**Dependency:**

The following parameters are influenced using p0230:

p0230 = 1:

- > p0233 (power unit, motor reactor) = filter inductance

p0230 = 3:

- > p0233 (power unit, motor reactor) = filter inductance
- > p0234 (power unit sine-wave filter capacitance) = filter capacitance
- > p0290 (power unit overload response) = inhibit pulse frequency reduction
- > p1082 (maximum speed) = Fmax filter / pole pair number
- > p1800 (pulse frequency) >= nominal pulse frequency of the filter
- > p1802 (modulator modes) = space vector modulation without overcontrol
- > p1811 (modulator configuration) = wobulation amplitude
- > p1909 (motor data identification, control word) = only Rs measurement

p0230 = 4:

- > p0290 (power unit overload response) = inhibit pulse frequency reduction
- > p1802 (modulator modes) = space vector modulation without overcontrol
- > p1811 (modulator configuration) = wobulation amplitude
- > p1909 (motor data identification, control word) = only Rs measurement

The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted.

--> p0233 (power unit, motor reactor) = filter inductance

--> p0234 (power unit sine-wave filter capacitance) = filter capacitance

--> p1082 (maximum speed) = Fmax filter / pole pair number

--> p1800 (pulse frequency) >= nominal pulse frequency of the filter

Refer to: p0233, p0234, p0290, p1082, p1800, p1802

**Note:** if a filter type cannot be selected, then this filter type is not permitted for the Motor Module.

p0230 = 1:

The output frequency of booksize power units with output reactors is restricted to 120 Hz, for blocksize and chassis power units, to 150Hz. The maximum pulse frequency for booksize and blocksize power units is 4 kHz, for chassis power units, twice the rated pulse frequency (2.5 kHz or 4 kHz).

p0230 = 2:

Chassis power units with dv/dt filter, depending on the rated pulse frequency, may be operated with a maximum pulse frequency of p1800 = 2.5 kHz or 4 kHz. The output frequency is limited to 150 Hz.

p0230 = 3:

Sine-wave filters with a rated pulse frequency of 1.25 or 2.5 kHz should only be operated with a current controller sampling rate p0115[0] = 400 µs, sine-wave filters with a rated pulse frequency of 2 or 4 kHz with p0115[0] = 250 µs.

The sine-wave filter cannot be selected if the current controller sampling rate has not been appropriately set.

Chassis power units with sine-wave filter are limited to output frequencies of 115 Hz or 150 Hz.

	Min 0.0 [%]	Max 100.0 [%]	Factory setting [0] 6.0 [%] [1] 16.0 [%]
<b>Description:</b>	Sets the shutdown thresholds for the ground fault monitoring. The setting is made as a percentage of the maximum power unit current (r0209).		
<b>Index:</b>	[0] = Threshold at which pre-charging starts [1] = Threshold at which pre-charging stops		
<b>Dependency:</b>	Refer to: F30021		
<b>Note:</b>	The parameter only applies to booksize and chassis power units. De-activating the ground fault monitoring: - Sequence: --> p0287[1] = 0 --> p0287[0] = 0 - irrespective of the firmware version of the power unit. Sets the thresholds: - the prerequisite is at least firmware version 2.2 of the power unit.		
<b>r0289</b>	<b>CO: Maximum power unit output current / PU I_outp max</b>		
VECTOR_G	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: -	Func. diagram: -
	P-Group: Displays, signals	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: p2002	Expert list: 1
	Min - [Arms]	Max - [Arms]	Factory setting - [Arms]
<b>Description:</b>	Displays the actual maximum output current of the power unit taking into account derating factors.		
<b>p0290</b>	<b>Power unit overload response / PU overld response</b>		
VECTOR_G	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dynamic index: -	Func. diagram: 8014
	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 3	Factory setting 0
<b>Description:</b>	Sets the response to a thermal overload condition of the power unit.		

The following quantities can result in a response to thermal overload:

- heat sink temperature (r0037 index 0)
- chip temperature (r0037 index 1)
- power unit overload I2T (r0036)

Possible measures to avoid thermal overload:

- reduce the output current limit r0289 and r0067 (for closed-loop speed/velocity or torque/force control) or the output frequency (for U/f control) indirectly via the output current limit and the intervention of the current limiting controller).
- reduce the pulse frequency (only for vector control).

A reduction, if parameterized, is always realized after an appropriate alarm is output.

**Value:**

0:	Reduce output current or output frequency
1:	No reduction, shutdown when overload threshold is reached
2:	Reduce I <sub>output</sub> or f <sub>output</sub> and f <sub>pulse</sub> (not using I2t)
3:	Reduce the pulse frequency (not using I2t)

**Dependency:** If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1).

If a fault or alarm is present, then r2135.13 or r2135.15 is set.

Refer to: r0036, r0037, p0108, r0108, p0230, r2135

Refer to: A05000, A05001, A07805

**Caution:** If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.

**Note:** The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans).

Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through.

For p0290 = 2, 3, the I2t overload detection of the power unit does not influence the responses.

When the motor data identification routine is selected, p0290 cannot be changed.

---

### r0293 CO: Power unit alarm threshold model temperature / PU A\_thr mod\_temp

**p0300[0...n] Motor type selection / Mot type sel**

<b>VECTOR_G</b>	<b>Can be changed:</b> C2(1, 3)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 6310
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 10001	<b>Factory setting</b> 0

**Description:** Selects the motor type or starts to read in the motor parameters for a motor with DRIVE-CLiQ (p0300 = 10000 or 10001, if there is a second data set).  
For p0300 < 10000 the following applies:  
The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:  
1 = Rotating induction motor  
2 = Rotating synchronous motor  
3 = Linear induction motor (reserved)  
4 = Linear synchronous motor  
5 = Synchronous motor separately-excited  
7 = SIEMOSYN motor  
8 = Reluctance motor  
The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/AOP).

**Value:**

- 0: No motor
- 1: Induction motor (rotating)
- 2: Synchronous motor (rotating, permanent-magnet)
- 7: SIEMOSYN motor
- 8: Reluctance motor
- 10: 1LE1 standard induction motor
- 11: 1LA1 standard induction motor
- 12: 1LE2 standard induction motor (NEMA)
- 13: 1LG6 standard induction motor
- 15: 1LA5 standard induction motor
- 16: 1LA6 standard induction motor
- 17: 1LA7 standard induction motor
- 18: 1LA8 / 1PQ8 standard induction motor
- 19: 1LA9 standard induction motor
- 102: 1PH2 induction motor
- 104: 1PH4 induction motor
- 107: 1PH7 induction motor

108: 1PH8 induction motor  
111: Induction motor (rotary) for OEMs  
134: 1PM4 induction motor  
136: 1PM6 induction motor  
166: 1PL6 induction motor  
222: Synchronous motor (rotary) for OEMs  
264: 1FW4 synchronous motor  
283: 1FW3 synchronous motor  
10000: Motor with DRIVE-CLiQ  
10001: Motor with DRIVE-CLiQ 2nd data set

**Dependency:** Motors, selection 206, 236, 237 cannot be operated (also not as motor with DRIVE-CLiQ).

p0300 = 5 cannot be selected with SINAMICS G.

When the motor type is changed, the code number in p0301 may be reset to 0.

p0300 = 12 can only be selected for p0100 = 1 (NEMA).

When selecting a motor type from the 1LA5 and 1LA7 series, parameters p0335, p0626, p0627 and p0628 of the thermal motor model are pre-assigned as a function of p0307 and p0311.

When selecting a 1FW4 motor, if the motor database permits this, when exiting commissioning then p1750 bit 5 is automatically set. This is the reason that after exiting commissioning, all parameters must be saved and a warm restart must be initiated (e.g. p0009=30, p0976=3).

Refer to: p0301

**Caution:**

**Caution:**

A permanent-magnet synchronous motor cannot be operated with an SSI encoder without HTL/TTL track.

A separately-excited synchronous motor can only be operated with an SSI encoder if this is used as the second encoder and an HTL/TTL encoder is used as the first encoder.

If a catalog motor is selected (p0300 ≥ 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 2 for p0301 = 2xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.

The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):

Type/code number ranges

102 / 102xx, 112xx, 122xx

104 / 104xx, 114xx, 124xx

107 / 107xx, 117xx, 127xx

108 / 108xx, 118xx, 128xx, 138xx, 148xx, 158xx

134 / 134xx, 144xx, 154xx

136 / 136xx, 146xx, 156xx

166 / 166xx, 176xx, 186xx

264 / 264xx, 274xx, 284xx, 294xx

283 / 283xx, 293xx

**Notice:** For 1PQ8 motors (p0300 = 18) the fan type p0335 should be set to 5.

**Note:** With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with p0300 = 10001, the motor parameters of a second data set (if available).

If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.

A motor type with a value above p0300 ≥ 100 describes motors for which a motor parameter list exists.

Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.

This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

<b>p0301[0...n]</b>	<b>Motor code number selection / Mot code No. sel</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Motor <b>Not for motor type:</b> FEM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	The parameter is used to select a motor from a motor parameter list. When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists.		
<b>Dependency:</b>	Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. For 1PH2, 1PH4, 1PH7, 1PM4, 1PM6, 1FT6 motors, code numbers are also possible, whose fourth decimal position is greater by a value of 1 or 2 than the matching motor type in p0300. For 1FE1 motors, the third decimal position can be higher by a value of 1. Refer to: p0300		
<b>Note:</b>	The motor code number can only be changed if the matching catalog motor was first selected in p0300. For a motor with DRIVE-CLiQ, p0301 cannot be changed. In this case, p0301 is automatically written to the code number of the motor parameter read in (r0302) if p0300 is set to 10000. When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected.		
<b>r0302[0...n]</b>	<b>Motor code number of motor with DRIVE-CLiQ / Motor code Mot DLQ</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Unsigned16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the motor code number from the saved motor data from a motor with DRIVE-CLiQ.		
<b>Note:</b>	Drive commissioning can only be exited if the code number that was downloaded (r0302) matches the stored code number (p0301). If the numbers differ, then the motor data set should be re-loaded using p0300 = 10000. The motor data are always expected from the first encoder that is assigned to the drive data sets (refer to p0187 = encoder 1) data set number. The value is not updated cyclically but only on specific events (e.g. update DRIVE-CLiQ device). r0302 = 0: No motor with DRIVE-CLiQ found		
<b>r0303[0...n]</b>	<b>Motor with DRIVE-CLiQ status word / Motor w DLQ ZSW</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Unsigned16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the status word of the automatic motor parameter sensing of a motor with DRIVE-CLiQ. Motor parameter sensing takes place in the following events if the SMI is connected to the Motor Module and the encoder is activated (p0145): - Warm restart - downloading projects. - POWER ON (off/on). - where p0300 = 10000, 10001.		

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Motor data set selected	MDS1	MDS0	-
	01	Motor connection type	Delta	Star	-
	02	Windings can be changed	Yes	No	-
	03	Windings can be changed number	2	0	-

**Dependency:** Refer to: p0145, p0300

**Note:** SMI: SINAMICS Sensor Module Integrated

### p0304[0...n] Rated motor voltage / Mot U<sub>rated</sub>

VECTOR_G	<b>Can be changed:</b> C2(1, 3)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 6300, 6724
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0 [Vrms]	<b>Max</b> 20000 [Vrms]	<b>Factory setting</b> 0 [Vrms]

**Description:** Sets the rated motor voltage (rating plate).

**Dependency:** Refer to: p0349

**Caution:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** When the parameter value is entered the connection type of the motor (star-delta) must be taken into account.

### p0305[0...n] Rated motor current / Mot I<sub>rated</sub>

VECTOR_G	<b>Can be changed:</b> C2(1, 3)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 6300
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.00 [Arms]	<b>Max</b> 10000.00 [Arms]	<b>Factory setting</b> 0.00 [Arms]

**Description:** Sets the rated motor current (rating plate).

**Dependency:** Refer to: p0349

**Caution:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Notice:** If p0305 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).

If the rated motor current exceeds twice the maximum drive converter current (r0209), then the maximum current is reduced due to the current harmonics that increase overproportionally (r0067).

**Note:** When the parameter value is entered the connection type of the motor (star-delta) must be taken into account.

### p0306[0...n] Number of motors connected in parallel / Motor qty

VECTOR_G	<b>Can be changed:</b> C2(1, 3)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Unsigned8	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> -
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> FEM	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 1	<b>Max</b> 50	<b>Factory setting</b> 1

**Description:** Number of motors that can be operated in parallel using one motor data set.

Depending on the motor number entered, internally an equivalent motor is calculated.

The following should be carefully observed for motors connected in series:

The following rating plate data should only be entered for one motor:

- resistances and inductances: p0350 ... p0361

- currents: p0305, p0320, p0323, p0325, p0329, p0389, p0390, p0391, p0392

- power ratings: p0307

- masses/moments of inertia: p0341, p0344

All other parameters take into account the replacement/equivalent motor (e.g. r0331, r0333).

**Recommend.:** For motors connected in parallel, external thermal protection should be provided for each individual motor.

**Dependency:** Refer to: r0331

**Caution:**

The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)).

The mounting regulations when connecting motors in parallel must be carefully maintained! Especially for synchronous motors, the pole position of motors that are rigidly coupled with one another (mechanically) must be identical. The number of motors set must correspond to the number of motors that are actually connected in parallel.

After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1).

For synchronous motors connected in parallel with p1300 >= 20, the following applies:

- the individual motors must be mechanically coupled with one another and the EMF must be aligned to one another.

For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies:

- an individual motor must not be loaded beyond its stall point.

**Notice:** If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned. This is not the case when commissioning the motor (p0010 = 3).

**Note:** Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel. Separately-excited synchronous motors must not be connected in parallel.

Synchronous and reluctance motors that are not coupled with one another align themselves when the pulses are switched in. If the motors have different load levels, then equalization currents flow between the motors.

---

#### p0307[0...n] **Rated motor power / Mot P<sub>rated</sub>**

VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Unsigned16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> 5300 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the number of motor pole pairs. The value is used for internal calculations. r0313 = 1: 2-pole motor r0313 = 2: 4-pole motor, etc.		
<b>Dependency:</b>	For p0314 > 0, the entered value is displayed in r0313. For p0314 = 0, the pole pair number (r0313) is automatically calculated from the rated power (p0307), rated frequency (p0310) and rated speed (p0311). Refer to: p0307, p0310, p0311, p0314		
<b>Note:</b>	For the automatic calculation, the pole pair number is set to the value of 2 if the rated speed or the rated frequency is zero.		
<b>p0314[0...n]</b>	<b>Motor pole pair number / Mot pole pair No.</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 255	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the motor pole pair number. p0314 = 1: 2-pole motor r0314 = 2: 4-pole motor, etc.		
<b>Dependency:</b>	For p0314 = 0, the pole pair number is automatically calculated from the rated frequency (p0310) and the rated speed (p0311) and displayed in r0313.		
<b>Notice:</b>	If p0314 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).  For induction motors, the value need only be input if the rated data of a generator is entered therefore resulting in a negative rated slip. In this case, the number of pole pairs in r0313 is too low by 1 and must be manually corrected.		
<b>p0316[0...n]</b>	<b>Motor torque constant / Mot kT</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.00 [Nm/A]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 28_1 <b>Scaling:</b> - <b>Max</b> 400.00 [Nm/A]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> p0100 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Nm/A]
<b>Description:</b>	Sets the torque constant of the synchronous motor. p0316 = 0: The torque constant is calculated from the motor data. p0316 > 0: The selected value is used as torque constant.		
<b>Dependency:</b>	Refer to: r0334		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	This parameter is not used for induction motors (p0300 = 1xx).		

<b>p0318[0...n]</b>	<b>Motor stall current / Mot I_standstill</b>		
VECTOR_G	<b>Can be changed:</b> C2(3) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.00 [Arms]	<b>Access level:</b> 4 <b>Func. diagram:</b> 8017 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the stall current for synchronous motors (p0300 = 2xx).		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The parameter is used for the I2t monitoring of the motor (refer to p0611). This parameter is not used for induction motors (p0300 = 1xx).		
<b>p0320[0...n]</b>	<b>Motor rated magnetizing current/short-circuit current / Mot I_mag_rated</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> REL, FEM <b>Min</b> 0.000 [Arms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 5000.000 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 5722 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [Arms]
<b>Description:</b>	Induction motors: Sets the rated motor magnetizing current. For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331. Synchronous motors: Sets the rated motor short-circuit current.		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The magnetization current p0320 for induction motors (not for catalog motors) is reset when quick commissioning is exited with p3900 > 0. VECTOR: If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF r0337 remains constant.		
<b>p0322[0...n]</b>	<b>Maximum motor speed / Mot n_max</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.0 [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.0 [rpm]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [rpm]
<b>Description:</b>	Sets the maximum motor speed.		
<b>Dependency:</b>	Refer to: p1082		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Notice:</b>	If p0322 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).		

<b>p0323[0...n]</b>	<b>Maximum motor current / Mot I_max</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, FEM <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 20000.00 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 5722 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the maximum permissible motor current (e.g. de-magnetizing current for synchronous motors).		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Notice:</b>	If p0323 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).		
<b>Note:</b>	The parameter has no effect for induction motors. The parameter has not effect for synchronous motors if a value of 0.0 is entered. The user-selectable current limit is entered into p0640.		
<b>p0324[0...n]</b>	<b>Winding maximum speed / Winding n_max</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.0 [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.0 [rpm]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [rpm]
<b>Description:</b>	Sets the maximum speed for the winding.		
<b>Dependency:</b>	Refer to: p1082		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Notice:</b>	If p0324 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).		
<b>p0325[0...n]</b>	<b>Motor pole position identification current, 1st phase / Mot PolID I 1st ph</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.000 [Arms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.000 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [Arms]
<b>Description:</b>	Sets the current for the 1st phase of the two-stage technique for pole position identification routine. The current of the 2nd phase is set in p0329. The two-stage technique is selected with p1980 = 4.		
<b>Dependency:</b>	Refer to: p0329, p1980, p1982, r1984, r1985, r1987, p1990		
<b>Notice:</b>	When the motor code (p0301) is changed, it is possible that p0325 is not pre-assigned. p0325 can be pre-assigned using p0340 = 3.		
<b>Note:</b>	The value is automatically pre-assigned for the following events: - For p0325 = 0 and automatic calculation of the closed-loop control parameters (p0340 = 1, 2, 3). - for quick commissioning (p3900 = 1, 2, 3).		

<b>p0327[0...n]</b>	<b>Optimum motor load angle / Mot phi_load opt</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.0 [°]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 135.0 [°]	<b>Access level:</b> 3 <b>Func. diagram:</b> 5722 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 90.0 [°]
<b>Description:</b>	Sets the optimum load angle for synchronous motors with reluctance torque (e.g. 1FE ... motors). SERVO: The load angle is measured at 1.5 x rated motor current. VECTOR: The load angle is measured at the rated motor current.		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	This parameter has no significance for induction motors. For synchronous motors without reluctance torque, a angle of 90 degrees must be set. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).		
<b>p0328[0...n]</b>	<b>Motor reluctance torque constant / Mot kT_reluctance</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> -1000.00 [mH]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000.00 [mH]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [mH]
<b>Description:</b>	Sets the reluctance torque constant for synchronous motors with reluctance torque (e.g. 1FE ... motors). This parameter has no significance for induction motors.		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	For synchronous motors without reluctance torque, the value 0 must be set.		
<b>p0329[0...n]</b>	<b>Motor pole position identification current / Mot PolID current</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.00 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the current for the pole position identification routine (p1980 = 1). For a two-stage technique (p1980 = 4), the current is set for the 2nd phase. The current for the 1st phase is set in p0325.		
<b>Dependency:</b>	Refer to: p0325, p1980, p1982, r1984, r1985, r1987, p1990		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>r0330[0...n]</b>	<b>Rated motor slip / Mot slip_rated</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> - [Hz]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [Hz]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [Hz]
<b>Description:</b>	Displays the rated motor slip.		

**Dependency:** The rated slip is calculated from the rated frequency, rated speed and number of pole pairs.

Refer to: p0310, p0311, r0313

**Note:** The parameter is not used for synchronous motors (p0300 = 2xx).

<b>r0331[0...n] Actual motor magnetizing current/short-circuit current / Mot I_mag_rtd act</b>			
VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 5722, 6722, 6724
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL, FEM	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> - [Arms]	<b>Max</b> - [Arms]	<b>Factory setting</b> - [Arms]
<b>Description:</b>	Induction motor: Displays the rated magnetizing current from p0320. For p0320 = 0, the internally calculated magnetizing current is displayed. Synchronous motor: Displays the rated short-circuit current from p0320.		
<b>Dependency:</b>	If p0320 was not entered, then the parameter is calculated from the rating plate parameters.		
<b>Note:</b>	In the case of multi-motor operation r0331 is increased by the factor p0306 compared to p0320.		

<b>r0332[0...n] Rated motor power factor / Mot cos_phi_rated</b>			
VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> -
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> PEM, REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> -
<b>Description:</b>	Displays the rated power factor for induction motors. For IEC motors, the following applies (p0100 = 0): For p0308 = 0, the internally-calculated power factor is displayed. For p0308 > 0, this value is displayed. For NEMA motors, the following applies (p0100 = 1): For p0309 = 0, the internally-calculated power factor is displayed. For p0309 > 0, this value is converted into the power factor and displayed.		
<b>Dependency:</b>	If p0308 is not entered, the parameter is calculated from the rating plate parameters.		
<b>Note:</b>	The parameter is not used for synchronous motors (p0300 = 2xx).		

<b>r0333[0...n] Rated motor torque / Mot M_rated</b>			
VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> -
	<b>P-Group:</b> Motor	<b>Units group:</b> 7_4	<b>Unit selection:</b> p0100
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> - [Nm]	<b>Max</b> - [Nm]	<b>Factory setting</b> - [Nm]
<b>Description:</b>	Displays the rated motor torque.		
<b>Dependency:</b>	IEC drives (p0100 = 0): unit Nm NEMA drives (p0100 = 1): unit lbf ft		
<b>Note:</b>	For induction and reluctance motors, r0333 is calculated from p0307 and p0311. For synchronous motors, r0333 is calculated from p0305, p0316, p0327 and p0328. The result can deviate from the input in p0312. If p0316 = 0, then r0333 = p0312 is displayed. In the case of multi-motor operation r0333 is increased by the factor p0306 compared to the rated torque of an individual motor.		

<b>r0334[0...n]</b>	<b>Actual motor-torque constant / Mot kT act</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> - [Nm/A]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 28_1 <b>Scaling:</b> - <b>Max</b> - [Nm/A]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0100 <b>Expert list:</b> 1 <b>Factory setting</b> - [Nm/A]
<b>Description:</b>	Displays the torque constant of the synchronous motor used.		
<b>Dependency:</b>	IEC drives (p0100 = 0): unit Nm / A NEMA drives (p0100 = 1): unit lbf ft / A Refer to: p0316		
<b>Note:</b>	This parameter is not used for induction motors (p0300 = 1xx). For synchronous motors, parameter r0334 = p0316 is displayed. For p0316 = 0, r0334 is calculated from p0305 and p0312 or p0305, p0307, and p0311.		
<b>p0335[0...n]</b>	<b>Motor cooling type / Motor cooling type</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3), T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 128	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the motor cooling system used.		
<b>Value:</b>	0: Non-ventilated 1: Forced cooling 2: Liquid cooling 4: Non-ventilated and internal fan 5: Forced cooling and internal fan 6: Liquid cooling and internal fan 128: No fan		
<b>Dependency:</b>	For 1LA5 and 1LA7 motors (refer to p0300), the parameter is pre-set as a function of p0307 and p0311.		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The parameter influences the thermal 3-mass motor model. 1LA1 and 1LA8 motors are characterized by the fact that they have an internal rotor fan. This "internal cooling" lies within the motor frame and is not visible. Air is not directly exchanged with the motor ambient air. For 1PQ8 motors, p0335 should be set to 5 as these motors are force-ventilated motors. p0335 = 128 applies for 1LA7 motors, frame size 56. These are operated without a fan.		
<b>r0336[0...n]</b>	<b>Actual rated motor frequency / Mot f<sub>rated</sub> act</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> - [Hz]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [Hz]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [Hz]
<b>Description:</b>	Displays the rated frequency of the motor. For p0310 > 0, this value is displayed.		
<b>Dependency:</b>	Refer to: p0311, p0314		
<b>Note:</b>	For p0310 = 0 or for synchronous motors, the rated motor frequency r0336 is calculated from the rated speed and the pole pair number. For p0310 > 0, this value is displayed (not for synchronous motors).		

<b>r0337[0...n]</b>	<b>Rated motor EMF / Mot EMF_rated</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> REL <b>Min</b> - [Vrms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [Vrms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [Vrms]
<b>Description:</b>	Displays the rated EMF of the motor.		
<b>Note:</b>	EMF: Electromagnetic force		
<b>r0339[0...n]</b>	<b>Rated motor voltage / Mot U_rated</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> REL <b>Min</b> - [Vrms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [Vrms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [Vrms]
<b>Description:</b>	Displays the rated motor voltage.		
<b>Note:</b>	For induction motors (p0300 = 1xx) the parameter is set to p0304. For synchronous motors, parameter r0339 = p0304 is displayed. If p0304 = 0, then r0339 is calculated from p0305 and p0316.		
<b>p0340[0...n]</b>	<b>Automatic calculation, motor/control parameters / Calc auto par</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 5	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Setting to automatically calculate motor parameters and U/f open-loop and closed-loop control parameters from the rating plate data.		
<b>Value:</b>	0: No calculation 1: Complete calculation 2: Calculation of equivalent circuit diagram parameters 3: Calculation of closed-loop control parameters 4: Calculation of controller parameters 5: Calculation of technological limits and threshold values		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. The following parameters are influenced using p0340: The parameters designated with (*) are not overwritten for catalog motors (p0300 > 100). **Note:**

p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5 without overwriting the motor parameters from the Siemens motor lists (p0301 > 0).

p0340 = 2 calculates the motor parameters (p0350 ... p0360), but only if it does involve a Siemens catalog motor (p0301 = 0).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

If the STARTER commissioning software writes a 3 into p0340 when "downloading to target device", then this corresponds to a "complete calculation of the motor/control parameters without equivalent circuit diagram data". The same calculations are carried out as for p0340 = 1, however, without the equivalent circuit diagram parameters of the motor (p0340 = 2), the motor moment of inertia (p0341) and the motor weight (p0344).

For third-party linear synchronous motors (p0300 = 4) equivalent circuit diagram data are not calculated (p0340 = 2).

<b>Dependency:</b>	IEC drives (p0100 = 0): unit kg NEMA drives (p0100 = 1): unit lb		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The parameter influences the thermal 3 mass model of the induction motor. The parameter is not used for synchronous motors (p0300 = 2xx).		
<b>r0345[0...n]</b>	<b>Nominal motor starting time / Mot t_start_rated</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> REL <b>Min</b> - [s]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [s]
<b>Description:</b>	Displays the rated motor starting time. This time corresponds to the time from standstill up to reaching the motor rated speed and the acceleration with motor rated torque (r0333).		
<b>Dependency:</b>	Refer to: r0313, r0333, r0336, p0341, p0342		
<b>p0346[0...n]</b>	<b>Motor excitation build-up time / Mot t_excitation</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -20.000 [s]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 20.000 [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.		
<b>Caution:</b>	If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note). This is especially true for sensorless vector control or U/f control.		
			
<b>Notice:</b>	<p>If the parameter is set to 0 s for separately-excited synchronous motors (p0300 = 5), then an excitation current setpoint is generated even if the drive is powered down. In the base speed range, this is the no-load excitation current (p0389). In the field-weakening range, the value is reduced with the inverse value of the actual speed. An excitation current setpoint is not generated during de-magnetizing (p0347) and if an encoder fault is detected.</p> <p>When starting an encoderless separately-excited synchronous motor with vector control from standstill, the rotor position is detected using the field current ramp. The length of the ramp is pre-assigned from the motor data for p0346 = 0 s. If it crystallizes out that this time is too short, then it can be extended by entering a negative value in p0346, whereby otherwise, the excitation behavior corresponds with that for p0346 = 0 s. For all other cases, p0346 is internally limited downwards to 0 s.</p>		
<b>Note:</b>	<p>The parameter is calculated using p0340 = 1, 3.</p> <p>For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384).</p>		

For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.

<b>p0347[0...n]</b>	<b>Motor de-excitation time / Mot t_de-excitat.</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 20.000 [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the de-magnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.		
<b>Note:</b>	The parameter is calculated using $p0340 = 1, 3$ . For induction motors, the result depends on the rotor time constant (r0384). If this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).		
<b>p0349</b>	<b>System of units, motor equivalent circuit diagram data / Unit_sys mot ESB</b>		
VECTOR_G	<b>Can be changed:</b> C2(3) <b>Data type:</b> Integer16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the actual system of units for motor equivalent circuit diagram data.		
<b>Value:</b>	1: System of units, physical 2: System of units, referred		
<b>Dependency:</b>	Refer to: p0304, p0305, p0310		
<b>Note:</b>	The reference parameter for resistances of the rated motor impedance $Z = p0304 / (1.732 * p0305)$ is in the % units system. Inductances are converted into a resistance using the factor $2 * \pi * p0310$ . If a reference parameter (p0304, p305, p0310) is zero, then it is not possible to make a changeover to "referred" values (per unit values).		
<b>p0350[0...n]</b>	<b>Motor stator resistance, cold / Mot R_stator cold</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.00000 [ohm]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 16_1 <b>Scaling:</b> - <b>Max</b> 2000.00000 [ohm]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [ohm]
<b>Description:</b>	Sets the stator resistance of the motor at ambient temperature p0625 (phase value).		
<b>Dependency:</b>	Refer to: p0625, r1912		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance (p0352).		

<b>p0352[0...n]</b>			
<b>Cable resistance / Mot R_cable cold</b>			
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.00000 [ohm]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 16_1 <b>Scaling:</b> - <b>Max</b> 120.00000 [ohm]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [ohm]
<b>Description:</b>	Resistance of the power cable between the Motor Module and motor.		
<b>Dependency:</b>	Refer to: p7003		
<b>Caution:</b>	The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.		
			
<b>Notice:</b>	Parallel circuits with one winding system (p7003 = 0): p0352 includes the feeder cable resistance of an individual Motor Module. The total feeder cable resistance is obtained from p0352 divided by the number of activated Motor Modules (refer to r0395). Parallel circuits with multi-winding system (p7003 = 1): p0352 includes the complete feeder cable resistance and is directly added to the stator resistance (refer to r0395).		
<b>Note:</b>	The parameter influences the temperature adaptation of the stator resistance. The motor identification sets the cable resistance to 20% of the measured total resistance if p0352 is zero at the time that the measurement is made. If p0352 is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance p0350. In this case, p0350 is a minimum of 10% of the measured value. Exception: For parallel circuit configurations with one winding system (p7003 = 0), the cable resistance is directly measured. It is important to note that only the component of an individual Motor Module is entered into p0352. The cable resistance is reset when quick commissioning is exited with p3900 > 0.		

<b>p0353[0...n]</b>			
<b>Motor series inductance / Mot L_series</b>			
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.000 [mH]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 15_1 <b>Scaling:</b> - <b>Max</b> 1000000.000 [mH]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [mH]
<b>Description:</b>	Sets the series inductance.		
<b>Note:</b>	For the automatic calculation with p0340 = 1, 3 or 4, the calculation of p1715 is influenced by p0353. The series inductance is reset when quick commissioning is exited with p3900 > 0.		

<b>p0354[0...n]</b>			
<b>Motor rotor resistance cold / damping resistance d axis / Mot R_r cold/R_D d</b>			
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> PEM, REL <b>Min</b> 0.00000 [ohm]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 16_1 <b>Scaling:</b> - <b>Max</b> 300.00000 [ohm]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6727 <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [ohm]
<b>Description:</b>	Sets the rotor/secondary section resistance of the motor at the ambient temperature p0625. For separately-excited synchronous motors: Sets the damping resistance in the rotor direction (d-axis). This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor data identification routine (p1910) (not for separately-excited synchronous motors).		
<b>Dependency:</b>	Refer to: p0625		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The parameter is not used for synchronous motors (p0300 = 2xx).		

<b>p0355[0...n]</b>	<b>Motor damping resistance, q axis / Mot R_damp q</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 0.00000 [ohm]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 16_1 <b>Scaling:</b> - <b>Max</b> 300.00000 [ohm]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6727 <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [ohm]
<b>Description:</b>	Sets the damping resistance of the separately-excited synchronous motor quadrature to the rotor direction (q axis). This parameter value is automatically calculated using the motor model (p0340 = 1, 2).		
<b>p0356[0...n]</b>	<b>Motor stator leakage inductance / Mot L_stator leak.</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.00000 [mH]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 15_1 <b>Scaling:</b> - <b>Max</b> 1000.00000 [mH]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [mH]
<b>Description:</b>	Induction motor, separately-excited synchronous motor: Sets the rotor leakage inductance of the motor. Synchronous motor: Sets the stator quadrature axis inductance of the motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	If the stator leakage inductance (p0356) for induction motors is changed outside the commissioning phase (p0010 > 0), the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960). For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is, therefore, ideal for a low current.		
<b>p0357[0...n]</b>	<b>Motor stator inductance, d axis / Mot L_stator d</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.00000 [mH]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 15_1 <b>Scaling:</b> - <b>Max</b> 1000.00000 [mH]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [mH]
<b>Description:</b>	Sets the stator direct-axis inductance of the synchronous motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		
<b>Note:</b>	The parameter is not used for separately-excited synchronous motors (p0300 = 5). For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is ideal for a low current.		
<b>p0358[0...n]</b>	<b>Motor rotor leakage inductance / damping inductance, d axis / Mot L_r leak / LDd</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> PEM, REL <b>Min</b> 0.00000 [mH]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 15_1 <b>Scaling:</b> - <b>Max</b> 1000.00000 [mH]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6727 <b>Unit selection:</b> p0349 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00000 [mH]
<b>Description:</b>	Sets the rotor/secondary section leakage inductance of the motor. For separately-excited synchronous motors: Sets the damping inductance in the rotor direction (d-axis).		

This value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910) (not for separately-excited synchronous motors).

**Caution:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** The parameter is not used for synchronous motors (p0300 = 2xx).

VECTOR:

If the rotor leakage inductance (p0358) for induction motors is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960).

<b>Description:</b>	<p>The saturation characteristic (flux as mapping of current) is defined using 4 points. This parameter specifies the x coordinate for the 3rd value pair of the characteristic. Induction motors (ASM) and separately-excited synchronous motors (SESM): The saturation characteristic describes the mapping of the magnetizing current onto the motor flux. The parameter sets the third magnetizing current as a [%] referred to the rated magnetizing current r0331 (ASM), which in turn is referred to the no-load excitation current (SESM).</p>		

Permanent-magnet synchronous motors (PESM):

The saturation characteristic describes the mapping of the stator quadrature axis current onto the stator quadrature axis flux.

The parameter sets the third stator quadrature axis current as a [%] referred to the rated motor current (p0305).

**Dependency:** The following applies for the magnetizing currents:

p0366 < p0367 < p0368 < p0369

The following applies for the stator quadrature axis current values (PESM):

20% < p0366 < p0367 < p0368 < p0369

Refer to: p0364

**Caution:** For permanent-magnet synchronous motors (PESM):

If the parameters are not set as specified, i.e. not in ascending order and to more than 20 %, the unsaturated quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.

**Note:** When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

**Max**

**Factory setting**

5.0 [%]

800.0 [%]

210.0 [%]

**Description:**

The saturation characteristic (flux as mapping of current) is defined using 4 points.

This parameter specifies the x coordinate for the 4th value pair of the characteristic.

Induction motors (ASM) and separately-excited synchronous motors (SESM):

The saturation characteristic describes the mapping of the magnetizing current onto the motor flux.

The parameter sets the fourth magnetizing current as a [%] referred to the rated magnetizing current r0331 (ASM), which in turn is referred to the no-load excitation current (SESM).

Permanent-magnet synchronous motors (PESM):

The saturation characteristic describes the mapping of the stator quadrature axis current onto the stator quadrature axis flux.

The parameter sets the fourth stator quadrature axis current as a [%] referred to the rated motor current (p0305).

**Dependency:** The following applies for the magnetizing currents:

p0366 < p0367 < p0368 < p0369

The following applies for the stator quadrature axis current values (PESM):

20% < p0366 < p0367 < p0368 < p0369

Refer to: p0365

**Caution:** For permanent-magnet synchronous motors (PESM):

If the parameters are not set as specified, i.e. not in ascending order and to more than 20 %, the unsaturated quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.

**Note:** When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

<b>p0391[0...n]</b>	<b>Current controller adaptation, starting point KP / I_adapt pt KP</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> REL <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 6000.00 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6714 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the starting point of the current-dependent current controller adaptation where the current controller gain p1715 is effective.		

<b>Dependency:</b>	Refer to: p0392, p0393, p1402, p1715
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
<b>Note:</b>	When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

---

**p0392[0...n]      Current controller adaptation, starting point KP adapted / I\_adapt pt KP adap**

VECTOR_G	<b>Can be changed:</b> C2(3), U, T	<b>Calculated:</b> CALC_MOD_REG	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 6714
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [Arms]	6000.00 [Arms]	0.00 [Arms]

**Description:** Sets the starting point of the current-dependent current controller adaptation where the adapted current controller gain p1715 x p0393 is effective.

**Dependency:** Refer to: p0391, p0393, p1402, p1715

**Caution:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

---

**p0393[0...n]      Current controller adaptation P gain scaling / I\_adapt Kp scal**

VECTOR_G	<b>Can be changed:</b> C2(3), U, T	<b>Calculated:</b> CALC_MOD_REG	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 6714
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [%]	1000.00 [%]	100.00 [%]

**Description:** Sets the factor for the current controller P gain in the adaptation range (e.g. r0078 > p0392, if p0392 > p0391). The value is referred to p1715.

**Dependency:** Refer to: p0391, p0392, p1402, p1715

**Caution:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** For p0393 = 100 % or p1402.2 = 0, the current controller adaptation is disabled and p1715 is effective over the entire range.  
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

---

**r0395[0...n]      Actual stator resistance / R\_stator act**

VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 6300, 6730, 6731, 6732

 10000: Identify encoder  
 10050: Encoder with EnDat2.1 interface identified  
 10051: DRIVE-CLiQ encoder identified  
 10058: Digital encoder (absolute) identified  
 10059: Digital encoder (incremental) identified  
 10100: Identify encoder (waiting)

**Caution:** An encoder type with p0400 < 9999 defines an encoder for which there is an encoder parameter list. When selecting a catalog encoder (p0400 < 9999) the parameters from the encoder parameter list cannot be changed (write protection). To remove write protection, the encoder type should be set to a third-party encoder (p0400 = 9999).

**Note:** The connected encoder can be identified by setting p0400 to 10000 or 10100. This assumes that the encoder supports this method, which is possible in the following cases: Motor with DRIVE-CLiQ, encoder with EnDat interface, DRIVE-CLiQ encoder.

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

When using an encoder with track A/B and zero pulse, as standard, fine synchronization is not set using a zero mark. If, for a synchronous motor, fine synchronization is to be realized using a zero mark, then the following must be executed:

- set p0400 to 9999
- set p0404.15 to 1

Prerequisite:

Coarse synchronization must be selected (e.g. pole position identification) and the zero pulse of the encoder must be either mechanically or electronically (p0431) adjusted to the pole position.

For p0400 = 10000 the following applies:

If an identification is not possible, then p0400 is set to 0.

For p0400 = 10100 the following applies:

If an identification is not possible, p0400 remains set to 10100 until it becomes possible.

<b>p0400[0...n]</b>		<b>Encoder type selection / Enc_typ sel</b>

Parameters p0410, p0432 and p0433 are set corresponding to the identified gearbox. If an identification is not possible, then p0402 is set to 9999.				
p0404[0...n]					
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> - <b>Max</b> -		<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Access level:</b> 3 <b>Func. diagram:</b> 4010, 4704 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0000 0000 0000 0000 0000 0000 0000 0000 bin		
<b>Description:</b>	Settings for the basic encoder properties.				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Linear encoder	Yes	No	-
	01	Absolute encoder	Yes	No	-
	02	Multiturn encoder	Yes	No	-
	03	Track A/B sq-wave	Yes	No	-
	04	Track A/B sine	Yes	No	-
	05	Track C/D	Yes	No	-
	06	Hall sensor	Yes	No	-
	08	EnDat encoder	Yes	No	-
	09	SSI encoder	Yes	No	-
	10	DRIVE-CLiQ encoder	Yes	No	-
	11	Digital encoder	Yes	No	-

12	Equidistant zero mark	Yes	No	-
13	Irregular zero mark	Yes	No	-
14	Distance-coded zero mark	Yes	No	-
15	Commutation with zero mark (not ASM)	Yes	No	-
16	Acceleration	Yes	No	-
17	Track A/B analog	Yes	No	-
20	Voltage level 5 V	Yes	No	-
21	Voltage level 24 V	Yes	No	-
22	Remote sense (only SMC30)	Yes	No	-
23	Resolver excit.	Yes	No	-

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400).

When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Notice:** If an SSI encoder (bit 9 = 1) is used as motor encoder for permanent-magnet synchronous motors, then this is only permissible in conjunction with an additional A/B track (bit 3 = 1 or bit 4 = 1).

**Note:** ZM: Zero mark

SMC: Sensor Module Cabinet

If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:

The track A/B is adjusted to match the magnetic position of the motor.

Re bit 01, 02 (absolute encoder, multiturn encoder):

These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.

Re bit 10 (DRIVE-CLiQ encoder):

This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.

Re bit 12 (equidistant zero mark):

The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).

The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.

Re bit 13 (irregular zero mark):

The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.

Re bit 14 (distance-coded zero mark):

The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

Re bit 15 (commutation with zero mark):

Only applicable for synchronous motors.

The function can be de-selected by priority via p0430.23.

For distance-coded zero marks, the following applies:

The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).

The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.

The fine synchronization is only started after two zero marks have been passed.

---

#### **p0405[0...n] Square-wave encoder track A/B / Sq-wave enc A/B**

ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> 4704
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 1111 bin

**Description:** Settings for the track A/B in a square-wave encoder.  
For square-wave encoders, p0404.3 must also be 1.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Signal	Bipolar	Unipolar	-
	01	Level	TTL	HTL	-
	02	Track monitoring	A/B <> -A/B	None	-
	03	Zero pulse	Same as A/B track	24 V unipolar	-
	04	Switching thresh	High	Low	-
	05	Pulse/direction	Active	Inactive	-

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** Re bit 02:  
When the function is activated, track monitoring can be de-activated by setting p0437.26.  
Re bit 05:  
When the function is activated, a frequency setpoint and a direction for traveling can be entered via an encoder interface.

#### p0407[0...n] Linear encoder grid division / Enc grid div

ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> 4010, 4704
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0 [nm]	<b>Max</b> 250000000 [nm]	<b>Factory setting</b> 16000 [nm]

**Description:** Sets the grid division for a linear encoder.

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** The lowest permissible value is 250 nm.

#### p0408[0...n] Rotary encoder pulse No. / Rot enc pulse No.

ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3

**Description:** Setting to invert actual values.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Invert speed actual value	Yes	No	4710, 4711, 4715 4704
	01	Invert position actual value	Yes	No	

**Note:** The inversion influences the following parameters:  
 Bit 00: r0061, r0063 (exception: encoderless control), r0094  
 Bit 01: r0482, r0483

#### p0410[0...n] Encoder inversion actual value / Enc inv act value

ENC (Lin_enc)	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> 4704, 4710, 4711, 4715
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 bin

**Description:** Setting to invert actual values.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Invert velocity actual value	Yes	No	4710, 4711, 4715 4704
	01	Invert position actual value	Yes	No	

**Note:** The inversion influences the following parameters:  
 Bit 00: r0061, r0063 (exception: encoderless control), r0094  
 Bit 01: r0482, r0483

#### p0411[0...n] Measuring gear, configuration / Meas gear config

ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> 4704
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 bin

**Description:** Sets the configuration for position tracking of a measuring gear.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Measuring gear, activate position tracking	Yes	No	-
	01	Axis type	Linear axis	Rotary axis	-
	02	Measuring gear, reset position	Yes	No	-
	03	Meas. gearbox, activate pos. tracking for incremental encoders	Yes	No	-

**Notice:** For p0411.3 = 1 the following applies:

If position tracking is activated for incremental encoders, only the position actual value is stored. Axis or encoder motion is not detected when de-activated! Any tolerance window entered in p0413 has no effect.

**Note:** For the following events, the non-volatile, saved position values are automatically reset:

- when an encoder replacement has been identified.
- when changing the configuration of the Encoder Data Set (EDS).

<b>p0412[0...n]</b>	<b>Measuring gear, absolute encoder, rotary, revolutions, virtual / Abs rot rev</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4194303	<b>Access level:</b> 1 <b>Func. diagram:</b> 4704 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.		
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).		
<b>Note:</b>	The resolution that is set must be able to be represented using r0483. For rotary axes/modulo axes, the following applies: p0411.0 = 1: This parameter is pre-set with p0421 and can be changed. p0411.3 = 1: The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419). For linear axes, the following applies: p0411.0 = 1: This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed. p0411.3 = 1: The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).		
<b>p0413[0...n]</b>	<b>Measuring gear, position tracking tolerance window / Pos track window</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0.00	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4294967300.00	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00
<b>Description:</b>	Sets a tolerance window for position tracking. After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output.		
<b>Dependency:</b>	Refer to: F31501, F32501, F33501		
<b>Caution:</b>	Rotation, e.g. through a complete encoder range is not detected.		
			
<b>Note:</b>	The value is entered in integer (complete) encoder pulses. For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).		

<b>p0414[0...n]</b>	<b>Redundant coarse position value relevant bits (identified) / Relevant bits</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3

<b>Value:</b>	0: SMx20 safety algorithm 10: DQL binary safety algorithm 11: DQL linear non-binary safety algorithm 255: Safety algorithm unknown		
<b>Dependency:</b>	Refer to: p9541		
<b>p0418[0...n]</b>	<b>Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned8	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> 4010, 4704
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	2	18	11
<b>Description:</b>	Sets the fine resolution in bits of the incremental position actual values.		

**Note:** The parameter applies for the following process data:  
 - Gx\_XIST1  
 - Gx\_XIST2 for reference mark or flying measurement  
 The fine resolution specifies the fraction between two encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048).  
 For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information.  
 For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy.

<b>p0419[0...n] Fine resolution absolute value Gx_XIST2 (in bits) / Enc fine Gx_XIST2</b>			
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned8 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 2	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 18	<b>Access level:</b> 3 <b>Func. diagram:</b> 4704, 4710 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 9
<b>Description:</b>	Sets the fine resolution in bits of the absolute position actual values.		
<b>Dependency:</b>	Refer to: p0418		
<b>Note:</b>	This parameter applies to process data Gx_XIST2 when reading the absolute value.

<b>Description:</b>	Sets the configuration for an SSI encoder.				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Transfer code	Binary code	Gray code	-
	02	Transfer absolute value twice	Yes	No	-
	06	Data line during the monoflop time	High level	Low level	-
<b>Caution:</b>	This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.				

**Note:** Re bit 06:  
The quiescent signal level of the data line corresponds to the inverted, set level.

p0430[0...n]	Sensor Module configuration / SM config		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	1110 0000 0000 1000 0000 0000 0000 0000 bin

**Description:** Sets the configuration of the Sensor Module.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	17	Burst oversampling	Yes	No	-
	18	Continuous oversampling (reserved)	Yes	No	-
	19	Safety position actual value sensing	Yes	No	-
	20	Speed calculation mode (only SMC30)	Incremental diff	Flank time meas	-
	21	Zero mark tolerance	Yes	No	-
	22	Rot pos adapt	Yes	No	-
	23	De-select commutation with zero mark	Yes	No	-
	24	Commutation with selected zero mark	Yes	No	-
	25	Switch off encoder voltage supply during parking	Yes	No	-
	27	Extrapolate position values	Yes	No	-
	28	Cubic correction	Yes	No	-
	29	Phase correction	Yes	No	-
	30	Amplitude correction	Yes	No	-
	31	Offset correction	Yes	No	-

**Notice:** A bit-wise configuration is only possible if the corresponding property is also present in r0458.

**Note:** Re bit 17 (burst oversampling):  
- if bit = 1, burst oversampling is switched on.

Re bit 18 (continuous oversampling):  
- if bit = 1, continuous oversampling is switched on.

Re bit 19 (Safety position actual value sensing):  
- if bit = 1, the Safety position actual value is transferred in the cyclic telegram.

Re bit 20 (speed calculation mode):  
- if bit = 1, the speed is calculated via incremental difference without extrapolation.  
- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.

Re bit 21 (zero mark tolerance):  
- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

Re bit 22 (rotor position adaptation):  
- if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

Re bit 23 (de-select commutation with zero mark):  
- The bit should only be set for encoders that have not been adjusted.

Re bit 24 (commutation with selected zero mark):  
- if bit = 1, the commutation position is corrected via a selected zero mark.

Re bit 25 (disconnect the encoder power supply on parking):  
- if bit = 1, the encoder power supply is switched off on parking (0 V).  
- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

Re bit 27 (extrapolate position values):  
- if bit = 1, the extrapolation of the position values is activated.

Re bit 28 (cubic correction):  
- if bit = 1, the cubic correction for track A/B sine is activated.

Re bit 29 (phase correction):

- if bit = 1, the phase correction for track A/B sine is activated.

Re bit 30 (amplitude correction):

- if bit = 1, the amplitude correction for track A/B sine is activated.

Re bit 31 (offset correction):

- if bit = 1, the offset correction for track A/B sine is activated.

**Notice:**

A bit-wise configuration is only possible if the corresponding property is also present in r0458.

**Note:**

Re bit 17 (burst oversampling):

- if bit = 1, burst oversampling is switched on.

Re bit 18 (continuous oversampling):

- if bit = 1, continuous oversampling is switched on.

Re bit 19 (Safety position actual value sensing):

- if bit = 1, the Safety position actual value is transferred in the cyclic telegram.

Re bit 20 (speed calculation mode):

- if bit = 1, the speed is calculated via incremental difference without extrapolation.

- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.

Re bit 21 (zero mark tolerance):

- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

Re bit 22 (rotor position adaptation):

- if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

Re bit 23 (de-select commutation with zero mark):

- The bit should only be set for encoders that have not been adjusted.

Re bit 24 (commutation with selected zero mark):

- if bit = 1, the commutation position is corrected via a selected zero mark.

Re bit 25 (disconnect the encoder power supply on parking):

- if bit = 1, the encoder power supply is switched off on parking (0 V).

- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

Re bit 27 (extrapolate position values):

- if bit = 1, the extrapolation of the position values is activated.

Re bit 28 (cubic correction):

- if bit = 1, the cubic correction for track A/B sine is activated.

Re bit 29 (phase correction):

- if bit = 1, the phase correction for track A/B sine is activated.

Re bit 30 (amplitude correction):

- if bit = 1, the amplitude correction for track A/B sine is activated.

Re bit 31 (offset correction):

- if bit = 1, the offset correction for track A/B sine is activated.

<b>p0431[0...n]</b>	<b>Angular commutation offset / Ang_com offset</b>		
VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> -180.00 [°]	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 180.00 [°]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [°]
<b>Description:</b>	Sets the angular commutation offset.		
<b>Dependency:</b>	The value is taken into account in r0094. Refer to: r0094, r1778		
<b>Caution:</b>	When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled: - The motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx). - The encoder is a resolver (p0404.23 = 1). - The actual speed value is inverted (p0410.0 = 1).		
<b>Notice:</b>	The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).		
<b>Note:</b>	Angular commutation offset, angular difference between electrical position of encoder and flux position. For p0404.5 = 1 (track C/D) the following applies: The angular offset in p0431 acts on track A/B, the zero mark on track C/D. For p0404.6 = 1 (Hall sensor) the following applies: The angular offset in p0431 acts on track A/B and the zero mark.		

<b>p0432[0...n]</b>	<b>Gearbox factor, encoder revolutions / Grbx_fact enc_rev</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Integer16 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the encoder revolutions for the gearbox factor of the encoder evaluation. The gearbox factor specifies the ratio between the encoder shaft and motor shaft (for motor encoders) or between the encoder shaft and the load.		
<b>Dependency:</b>	This parameter can only be set for p0402 = 9999. Refer to: p0402, p0410, p0433		
<b>Note:</b>	Negative gearbox factors should be implemented with p0410.		

<b>p0433[0...n]</b>	<b>Gearbox factor, motor/load revolutions / Grbx_fact mot_rev</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 1	<b>Max</b> 10000	<b>Factory setting</b> 1
<b>Description:</b>	Sets the motor and load revolutions for the gearbox factor of the encoder evaluation. The gearbox factor specifies the ratio between the encoder shaft and motor shaft (for motor encoders) or between the encoder shaft and the load.		
<b>Dependency:</b>	This parameter can only be set for p0402 = 9999. Refer to: p0402, p0410, p0432		
<b>Note:</b>	Negative gearbox factors should be implemented with p0410.		
<b>p0434[0...n]</b>	<b>Encoder SSI error bit / Enc SSI error bit</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 65535	<b>Factory setting</b> 0
<b>Description:</b>	Sets the position and level of the error bit in the SSI protocol.		
<b>Notice:</b>	The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.		
<b>Note:</b>	Value = dcba ba: Position of the error bit in the protocol (0 ... 63). c: Level (0: Low level, 1: High level). d: Status of the evaluation (0: Off, 1: On with 1 error bit, 2: On with 2 error bits ... 9: On with 9 error bits). For several error error bits, the following applies: - the position specified under ba and the additional bits are assigned increasing consecutively. - the level set under c applies to all error bits. Example: p0434 = 1013 --> The evaluation is switched in and the error bit is at position 13 with a low level. p0434 = 1113 --> The evaluation is switched in and the error bit is at position 13 with a high level.		
<b>p0435[0...n]</b>	<b>Encoder SSI alarm bit / Enc SSI alarm bit</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 65535	<b>Factory setting</b> 0
<b>Description:</b>	Sets the position and level of the alarm bit in the SSI protocol.		
<b>Notice:</b>	The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.		
<b>Note:</b>	Value = dcba ba: Position of the alarm bit in protocol (0 ... 63). c: Level (0: Low level, 1: High level). d: State of the evaluation (0: Off, 1: On).		

Example:

p0435 = 1014

--> The evaluation is switched in and the alarm bit is at position 14 with a low level.

p0435 = 1114

--> The evaluation is switched in and the alarm bit is at position 14 with a high level.

p0436[0...n]		Encoder SSI parity bit / Enc SSI parity bit	
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 65535	<b>Factory setting</b> 0
<b>Description:</b>	Sets the position and parity of the parity bit in the SSI protocol.		
<b>Notice:</b>	The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.		
<b>Note:</b>	Value = dcba ba: Position of the parity bit in the protocol (0 ... 63). c: Parity (0: even, 1: uneven). d: State of the evaluation (0: Off, 1: On). Example: p0436 = 1015 --> The evaluation is switched in and the parity bit is at position 15 with even parity. p0436 = 1115 --> The evaluation is switched in and the parity bit is at position 15 with uneven parity.		

p0437[0...n]		Sensor Module configuration extended / SM config ext			
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)		<b>Calculated:</b> -	<b>Access level:</b> 3	
	<b>Data type:</b> Unsigned32		<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -

<b>Description:</b> Sets the extended configuration of the Sensor Module.					
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Data logger	Yes	No	-
	01	Zero mark edge detection	Yes	No	-
	02	Correction position actual value XIST1	Yes	No	-
	04	Edge evaluation bit 0	Yes	No	-
	05	Edge evaluation bit 1	Yes	No	-
	06	Freeze the speed actual value for dn/dt errors	Yes	No	-
	07	Accumulate uncorrected encoder pulses	Yes	No	-
	11	Fault handling after PROFIdrive	Yes	No	-
	12	Activate additional messages	Yes	No	-
	13	Support absolute position for incremental encoder	Yes	No	4750
	25	Deselect monitoring multiturn representation in Gx_XIST2	Yes	No	-
	26	Deselect track monitoring	Yes	No	-
	28	EnDat linear encoder monitoring incremental/absolute	Yes	No	-
	29	EnDat encoder initialization with high accuracy	Yes	No	-
	31	Analog unipolar track monitoring	Yes	No	-
<b>Dependency:</b>		Refer to: p0430, r0459			

**Note:**

A value of zero is displayed if an encoder is not present.

Re bit 00:

When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.

Re bit 01:

If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.

For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.

Re bit 02:

If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.

Re Bit 04 and Bit 05:

The actual hardware only supports 1x or 4x signal evaluation.

Bit 5/4 = 0/0: Signal evaluation per period, 4x.

Bit 5/4 = 1/0: Illegal setting.

Bit 5/4 = 0/1: Signal evaluation per period, 1x.

Bit 5/4 = 1/1: Illegal setting.

Re bit 06:

If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.

Re bit 07:

If the bit is set, the encoder pulses which have not been corrected are added to p4688 at the zero mark.

Re bit 11:

If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.

Re bit 12:

Additional fault messages can be activated for extended fault diagnostics.

Re bit 13:

When the bit is set, for an incremental encoder with zero mark, the absolute value in Gn\_XIST2 can be requested via Gn\_STW.13.

Re bit 20:

If the bit is set, the bandwidth of the analog filter for SMx10 (resolver) and SMx20 (sin/cos encoder) can be set via p4660.

Re bit 26:

Track monitoring is de-activated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.

Re bit 28:

Monitoring of the difference between incremental and absolute position in the case of linear encoders.

Re bit 29:

When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.

Re bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.</p> <p>Re bit 07:</p> <p>If the bit is set, the encoder pulses detected as faulty between two zero marks are accumulated (p4688).</p> <p>Re bit 29:</p> <p>When the bit is set, the EnDat encoder is initialized under a certain velocity and, therefore, with high accuracy. If initialization at a higher velocity is requested, fault F31151, F32151, or F33151 is output.</p>																																																																																			

Re bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

<b>p0438[0...n]</b>	<b>Squarewave encoder filter time / Enc t_filt</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0.00 [µs]	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100.00 [µs]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.64 [µs]
<b>Description:</b>	Sets the filter time for a squarewave encoder. The hardware of the squarewave encoder only supports the following values: 0: No filtering 0.04 µs 0.64 µs 2.56 µs 10.24 µs 20.48 µs		
<b>Dependency:</b>	Refer to: r0452		
<b>Notice:</b>	If the filter time is too long, the track signals A/B/R may be suppressed and the appropriate messages output.		
<b>Note:</b>	The most suitable filter time depends on the number of pulses and maximum speed of the square-wave encoder. The filter time is automatically corrected to the next value when entering a non-specified value. In this case, no message is output. The effective filter time is displayed in r0452.		
<b>p0439[0...n]</b>	<b>Encoder ramp-up time / Enc ramp-up time</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0 [ms]
<b>Description:</b>	Sets the ramp-up time for the encoder. The encoder supplies stable track signals once this time has elapsed.		
<b>Caution:</b>	This parameter is automatically pre-set for encoders from the encoder list (p0400).		
<b>p0440[0...n]</b>	<b>Copy encoder serial number / Copy enc ser_no</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Integer16 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Copies the actual serial number of the encoder belonging to this Encoder Data Set (EDS) to p0441 ... p0445. Example: For p0440[0] = 1, the serial number of the encoder belonging EDS0 is copied to p0441[0] ... p0445[0].		
<b>Value:</b>	0: No action 1: Transfer serial number		
<b>Dependency:</b>	Refer to: p0441, p0442, p0443, p0444, p0445, r0460, r0461, r0462, r0463, r0464, p1990		
<b>Note:</b>	For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440.		

In the following cases, copying is automatically started in the following cases:

- 1.) When commissioning 1FT6, 1FK6, 1FK7 motors.
- 2.) When writing into p0431.
- 3.) For p1990 = 1.

p0440 is automatically set to 0 when the copying has been completed.

In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

**Dependency:**

Refer to: p0437, p0600, p0601

**Note:**

A value of zero is displayed if an encoder is not present.

Re bit 11:

When the property is set, the following parameters can be changed without the actual value in the encoder interface becoming invalid (state r0481.14 = 1 "parking encoder active"):

p0314, p0315, p0430, p0431, p0441, p0442, p0443, p0444, p0445

Re bit 12:

The extended functions can be configured using p0437.

Re bit 13:

Encoder faults can be acknowledged via Gn\_STW.15.

Re bit 14:

Only for internal Siemens use.

Re bit 23:

When the property is set, commutation with zero mark can be de-selected using p0430.23.

Re bit 24:

If the property is set, commutation to the selected zero mark can be carried out.

### **p0491 Motor encoder fault response ENCODER / Fault resp ENCODER**

VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	5	0

**Description:** Sets the behavior for the ENCODER fault response (motor encoder).

This means, for example, if an encoder fault occurs, encoderless operation can be automatically selected with a shutdown behavior that can be selected.

**Value:**

- 0: Encoder fault results in OFF2
- 1: Enc fault results in encoderless oper. and oper. continues
- 2: Encoder fault results in encoderless operation and OFF1
- 3: Encoder fault results in encoderless operation and OFF3
- 4: Encoder fault results in an armature short-cct int/DC braking
- 5: Enc fault results in encoderless op, operation continues, alarm

**Dependency:** The following parameters are relevant for encoderless operation.  
Refer to: p0341, p0342, p1470, p1472, p1517, p1612, p1755  
Refer to: F07575

**Caution:**

For a value = 1, 2, 3, the following applies:  
- encoderless operation must have been started.  
For a value = 1, the following applies:  
- in spite of the motor encoder fault that has occurred, the motor continues to operate.

**Note:** For a value = 1, 2, 3, the following applies:  
- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).  
- Not possible for separately excited synchronous motors (p0300 = 5).

---

**p0492 Square-wave encoder, maximum speed difference per sampling cycle /  
n\_dif max/samp\_cyc**

ENC	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [rpm]
-----	---	---	--

**Description:** Sets the maximum permissible speed difference within the current controller sampling time for squarewave encoders.

**Dependency:** Refer to: F31118, A31418

**Note:** For a value of 0.0, the speed change monitoring is disabled.  
if the set maximum speed difference is only exceeded for one sampling time of the current controller, then an appropriate alarm is output. However, if the maximum speed difference is exceeded over several sampling times, then a corresponding fault is output.

---

**p0492 Square-wave encoder, max. velocity difference per sampling cycle /  
v\_dif max/samp\_cyc**

ENC (Lin_enc)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0.00 [m/min]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000.00 [m/min]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [m/min]
---------------	---	---	--

**Description:** Sets the maximum permissible velocity difference within the current controller sampling time for square-wave encoders.

**Dependency:** Refer to: F31118, A31418

**Note:** For a value of 0.0, velocity change monitoring is disabled.  
if the set maximum velocity difference is only exceeded for one sampling time of the current controller, then an appropriate alarm is output. However, if the maximum speed difference is exceeded over several sampling times, then a corresponding fault is output.

<b>p0492</b>	<b>Maximum speed difference per sampling cycle / n_dif max/samp_cyc</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [rpm]
<b>Description:</b>	Sets the maximum permissible speed difference within the current controller sampling time.		
<b>Dependency:</b>	Refer to: r1408 Refer to: F07902, F31118, A31418, F32118, A32418, F33118, A33418		
<b>Note:</b>	For a value of 0.0, the speed change monitoring is disabled. The following applies for square-wave encoders: If the speed difference exceeds the threshold value p0492, depending on p0491, either encoderless closed-loop speed/torque control is selected or the drive is powered down with fault F3x118. The following applies for other speed encoders: If the speed difference exceeds threshold value p0492, in order to avoid subsequent faults, the old speed actual value is kept and after time p2178 shut down with fault F07902 (motor stalled).		
<b>p0493</b>	<b>Zero mark selection, input terminal / ZM_sel inp_term</b>		
ENC	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 8	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the input terminal for selecting the reference mark via BERO/switching signal when performing referencing with several zero marks. The encoder interface supplies the position of the reference mark, which was detected immediately after the positive edge of the BERO signal.		
<b>Value:</b>	0: No selection via BERO 1: DI/DO 9 (X122.10/X121.8) 2: DI/DO 10 (X122.12/X121.10) 3: DI/DO 11 (X122.13/X121.11) 4: DI/DO 13 (X132.10/X131.2) 5: DI/DO 14 (X132.12/X131.4) 6: DI/DO 15 (X132.13/X131.5) 7: DI/DO 8 (X122.9/X121.7) 8: DI/DO 12 (X132.9/X131.1)		
<b>Notice:</b>	For Cx32, NX10 and NX15, only DI/DO 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual). To the terminal designation: The first designation is valid for CU320, the second for CU310.		
<b>Note:</b>	Refer to the encoder interface for PROFIdrive. The terminal must be set as input (p0728). For p0493 = 0 (factory setting) the following applies: - there is no logic operation between the reference mark search and an input signal. For p0493 > 0, the following applies: - the positive edge of the input signal is evaluated. If the negative edge is to be evaluated, signal inversion must be parameterized via p0490. - if a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0580, p0680, p2517, or p2518.		

<b>p0493[0...n]</b>	<b>Zero mark selection, input terminal / ZM_sel inp_term</b>

**p0495 Equivalent zero mark, input terminal / ZM\_equiv input**

ENC	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 4735
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	8	0

**Description:** Selects the input terminal for connecting an equivalent zero mark (external encoder zero mark).

**Value:**

- 0: No equivalent zero mark (evaluation of the encoder zero mark)
- 1: DI/DO 9 (X122.10/X121.8)
- 2: DI/DO 10 (X122.12/X121.10)
- 3: DI/DO 11 (X122.13/X121.11)
- 4: DI/DO 13 (X132.10/X131.2)
- 5: DI/DO 14 (X132.12/X131.4)
- 6: DI/DO 15 (X132.13/X131.5)
- 7: DI/DO 8 (X122.9/X121.7)
- 8: DI/DO 12 (X132.9/X131.1)

**Notice:** For Cx32, NX10 and NX15, only DI/DO 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).  
For p0494 > 0, the setting in p0494 and p0495 is invalid.  
To the terminal designation:

The first designation is valid for CU320, the second for CU310.

**Note:** Refer to the encoder interface for PROFIdrive.

The terminal must be set as input.

For p0495 = 0 (factory setting), the encoder zero mark is evaluated as zero mark.

For p0495 > 0, the following applies:

Depending on the direction of motion, the positive or negative edge at the appropriate input is evaluated.

- increasing position actual values (r0482) --> the 0/1 edge is evaluated.

- decreasing position actual values (r0482) --> the 1/0 edge is evaluated.

Only one zero mark is supported. If function 2, 3 or 4 is selected, this results in a fault message in Gn\_ZSW.

The inversion of the inputs via p0490 affects the function "referencing with equivalent zero mark". This is the reason that the edge evaluation is interchanged as a function of the direction of motion.

An input can only be assigned to one encoder as measuring probe 1, 2 or equivalent zero mark. Exception: The same encoder can be simultaneously used as measuring probe and equivalent zero mark as both functions cannot be simultaneously requested.

---

<b>Description:</b>	Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0578.		
<b>Value:</b>	0: Standard drive (VECTOR) 1: Pumps and fans 2: Sensorless closed-loop control down to f = 0 (passive loads)		
<b>Dependency:</b>	Refer to: p2175, p2177		

**Note:**

The calculation of parameters dependent on the technology application can be called up as follows:

- when exiting quick commissioning using p3900 > 0
- when writing p0340 = 1, 3, 5
- when writing p0578 = 1

For p0500 = 0 and when the calculation is initiated, the following parameters are set:

p1574 = 10 V (for separately-excited synchronous motors: 20 V)

p1750.2 = 0

p1802 = 4 (SVM/FLB without overcontrol)

p1803 = 106 %

For p0500 = 1 and when the calculation is initiated, the following parameters are set:

p1574 = 2 V (for separately-excited synchronous motors: 4 V)

p1750.2 = 0

p1802 = 9 (edge modulation), if r0192.0 = 1

p1802 = 4, if r0192.0 = 0

p1803 = 106 %

For p0500 = 2 and when the calculation is initiated, the following parameters are set:

p1574 = 2 V (for separately-excited synchronous motors: 4 V)

p1750.2 = 1: Encoderless control of the induction motor is effective down to zero frequency.

This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited.

p1802 = 4 (SVM/FLB without overcontrol)

p1803 = 106 %

The setting of p1750 is only relevant for induction motors.

p1802 and p1803 are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

<b>Description:</b>	The inhibit list contains parameters that should be withdrawn from the automatic motor and closed-loop control parameter calculation (p0340, p0578).		
<b>Value:</b>	0: No parameter 600: Motor temperature sensor 640: Current limit 1082: Maximum speed 1460: Speed controller P gain 1462: Speed controller integral time 1470: Speed controller P gain, encoderless 1472: Speed controller integral time, encoderless 1520: Torque limit upper/motoring 1521: Torque limit lower/regenerative 1530: Power limit motoring 1531: Power limit regenerative 1590: Flux controller P gain 1592: Flux controller integral time 2141: Speed threshold 1 2142: Hysteresis speed 1		
<b>Note:</b>	p0570 defines the number of entries (starting at index 0) for which the inhibit should apply. p0572 can be used to define for which drive data sets the inhibit list should apply. If a motor data set is entered into a parameter number, then this is not overwritten as soon as only one drive data set refers to the motor data set (p0186).		
<b>p0572[0...n]</b>	<b>Activate/de-activate inhibit list / Inh_list act/deact</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Applications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Setting for activating/de-activating the inhibit list. Depending on the setting, the parameters of the inhibit list (p0571) should be overwritten when calculating the motor and closed-loop control parameters for the particular drive data set (DDS).		
<b>Value:</b>	0: No 1: Yes		

**Note:** If value = 0:  
The automatic calculation (p0340, p0578) also overwrites the parameters of the inhibit list (p0571).  
If value = 1:  
The automatic calculation (p0340, p0578) does not overwrite the parameters of the inhibit list (p0571).

---

**p0573 Inhibit automatic reference value calculation / Inhibit calc**

<b>B_INF, VECTOR_G</b>	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Applications	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0

**Description:** Setting to inhibit the calculation of reference parameters (e.g. p2000) when automatically calculating the motor and closed-loop control parameters (p0340, p3900).

**Value:** 0: No  
1: Yes

**Notice:** The inhibit for the reference value calculation is canceled when new motor parameters (e.g. p0305) are entered and only one drive data set exists (p0180 = 1). This is the case during initial commissioning.  
Once the motor and control parameters have been calculated (p0340, p3900), the inhibit for the reference value calculation is automatically re-activated.

**Note:** If value = 0:  
The automatic calculation (p0340, p3900) overwrites the reference parameters.  
If value = 1:  
The automatic calculation (p0340, p3900) does not overwrite the reference parameters.

	0.01	340.28235E36	1.00

**Description:** Sets the reference quantity for the technological units.  
 When changing over using changeover parameter p0595 to absolute units, all of the parameters involved refer to the reference quantity.

**Dependency:** Refer to: p0595

**Notice:** When changing over from one technological unit into another, or when changing the reference parameter, a changeover is not made.

#### p0600[0...n] Motor temperature sensor for monitoring / Mot temp\_sensor

VECTOR_G	<b>Can be changed:</b> C2(3), U, T	<b>Calculated:</b> CALC_MOD_ALL	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> 8016
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	21	0

**Description:** Sets the sensor to monitor the motor temperature.

**Value:**

- 0: No sensor
- 1: Temperature sensor via encoder 1
- 2: Temperature sensor via encoder 2
- 3: Temperature sensor via encoder 3
- 10: Temperature sensor via a BICO interconnection
- 11: Temperature sensor via Motor Module / CU terminals
- 20: Temperature sensor via a BICO interconnection p0608
- 21: Temperature sensor via a BICO interconnection p0609

**Dependency:** Refer to: r0458, p0601, p0603

**Caution:**

If, for a selected temperature sensor (p0600 > 0), the motor temperature sensor is not connected but another sensor, then the temperature adaptation of the motor resistances must be switched out. Otherwise, in controlled-loop operation, torque errors will occur that will mean that the drive will not be able to be stopped.

**Notice:****Note:**

The parameter is calculated in the drive using p0340 and is inhibited for p0340 > 0.

Re p0600 = 0:

With induction motors, the motor temperature is calculated using the motor temperature model (see also p0612.1).

Re p0600 = 1, 2, 3:

Bimetallic switch (p0601 = 4) and PT100 temperature sensor (p0601 = 5) are not supported.

Re p0600 = 10:

The BICO interconnection should be executed via connector input p0603.

Re p0600 = 11:

For SINAMICS S120 AC Drive (AC/AC) and using the Control Unit Adapter CUA31, the temperature sensor is connected at the adapter (X210).

Re p0600 = 20, 21:

The BICO interconnection should be executed via connector input p0608 or p0609.

Associated parameters: p0601, p4600 ... p4603, p4610 ... p4613

**p0601****Temperature sensor, sensor type / Temp\_sens type**

B\_INF

**Can be changed:** C2(3), U, T**Calculated:** -**Access level:** 2**Data type:** Integer16**Dynamic index:** -**Func. diagram:** -**P-Group:** Motor**Units group:** -**Unit selection:** -**Not for motor type:** -**Scaling:** -**Expert list:** 1**Min****Max****Factory setting**

0

4

0

**Description:**

Sets the sensor type for the temperature measurement at input X21 (booksize) or X41 (chassis).

The measured value is displayed in r0035.

**Value:**

0: No sensor

1: PTC alarm &amp; timer

2: KTY84

4: Bimetallic NC contact alarm &amp; timer

**Dependency:**

Refer to: r0035

**Note:**

The measured value display depends on the selected sensor type.

Re p0601 = 0 (no sensor):

--> r0035 = -200 °C

Re p0601 = 1 (PTC alarm & timer):

Tripping resistance = 1650 Ohm (lower resistance --> r0035 = -50 °C, higher resistance --> r0035 = 250 °C).

Re p0601 = 2 (KTY84):

Displays the temperature in °C.

Re p0601 = 4 (bimetallic NC contact alarm & timer):

r0035 = -50 °C

--> The tripping resistance is less than 100 Ohm (bimetallic NC contact is closed or has a short-circuit).

r0035 = 250 °C

--> The tripping resistance is greater than 100 Ohm (bimetallic NC contact is open, not connected or has a wire breakage).

When using the following components, a value of 4 is set as the factory setting and can no longer be changed:

- Basic Line Module (BLM) with internal Braking Module.

- Active Line Module (ALM) with line filter Active Interface Module (AIM, p0220[0] = 41 ... 45).

In these cases, in addition to the temperature display, the temperature is also monitored.

<b>p0601[0...n]</b>		<b>Motor temperature sensor type / Mot_temp_sens type</b>

<b>Description:</b>	Sets the power unit number to which the temperature sensor is connected. The value corresponds to the Power unit Data Set number (PDS) of the power unit. The number of power unit data sets is defined in p0120.		
<b>p0603</b>	<b>CI: Motor temperature signal source / Mot temp S_src</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), T <b>Data type:</b> Unsigned32 / FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> p2006 <b>Max</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> 8016 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source to evaluate the motor temperature via a BICO interconnection.		
<b>Dependency:</b>	Refer to: p0600		
<b>Note:</b>	Temperature sensor KTY: Valid temperature range -48 °C ... 248 °C. PTC temperature sensor: For a value = -50 °C, the following applies: Motor temperature < nominal response temperature of the PTC. For a value = 250 °C, the following applies: Motor temperature >= nominal response temperature of the PTC. Note: When using a Terminal Module 31 (TM31), the following applies: - the sensor type used is set using p4100. - the temperature signal is interconnected using CO: r4105.		
<b>p0604[0...n]</b>	<b>Mot_temp_mod 1/KTY alarm threshold / Mod 1/KTY A thresh</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.0 [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 21_1 <b>Scaling:</b> - <b>Max</b> 200.0 [°C]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8016 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 130.0 [°C]
<b>Description:</b>	Sets the alarm threshold for monitoring the motor temperature for motor temperature model 1 or KTY. After the alarm threshold is exceeded, alarm A07910 is output and timer (p0606) is started. If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.		
<b>Dependency:</b>	Refer to: p0606, p0612 Refer to: F07011, A07910		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The hysteresis is 2 K. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).		

<b>p0605[0...n]</b>	<b>Mot_temp_mod 1/2 threshold / Threshold</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.0 [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 21_1 <b>Scaling:</b> - <b>Max</b> 200.0 [°C]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8016, 8017 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 145.0 [°C]
<b>Description:</b>	Sets the threshold for monitoring the motor temperature for motor temperature model 1/2. Motor temperature model 1 (p0612.0 = 1): alarm threshold - Alarm A07910 is output after the alarm threshold is exceeded. Motor temperature model 2 (p0612.1 = 1): fault threshold - Fault F07911 is output after the fault threshold is exceeded.		
<b>Dependency:</b>	Refer to: p0606, p0611, p0612 Refer to: F07011, A07012		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The hysteresis is 2 K. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).		
<b>p0606[0...n]</b>	<b>Mot_temp_mod 2/KTY timer / Mod 2/KTY t_timer</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 600.000 [s]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8016 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the timer for monitoring the motor temperature for motor temperature model 2 or KTY. This timer is started when the temperature alarm threshold (p0604) is exceeded. If the timer has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output. If the temperature fault threshold (p0605) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output.		
<b>Dependency:</b>	Refer to: p0604, p0605 Refer to: F07011, A07910		
<b>Note:</b>	With p0606 = 0 s, the timer is de-activated and only the fault threshold is effective. KTY sensor: When setting the minimum value, the timer is disabled and a fault is not output until p0605 is exceeded. PTC sensor, bimetallic NC contact: The timer minimum value has no special significance.		
<b>p0607[0...n]</b>	<b>Temperature sensor fault timer / Sensor fault time</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 600.000 [s]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.100 [s]
<b>Description:</b>	Sets the timer between the output of alarm and fault for a temperature sensor fault. If there is a sensor fault, this timer is started. If the sensor fault is still present after the timer has expired, a corresponding fault is output.		
<b>Notice:</b>	The parameterized time is internally rounded-off to an integer multiple of 48 ms.		
<b>Note:</b>	If the motor is an induction motor, the timer is switched off when setting the minimum value and no alarm is output. Temperature monitoring is then based on the thermal model.		

<b>p0608[0...3]</b>	<b>CI: Motor temperature signal source 2 / Mot_temp S_src 2</b>

	<b>Not for motor type:</b> REL, FEM	<b>Scaling:</b> -	<b>Expert list:</b> 1		
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>		
	-	-	0010 bin		
<b>Description:</b>	Setting to activate the motor temperature model.				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Activating motor temperature model 1 (I2t)	Yes	No	-
	01	Activate motor temperature model 2	Yes	No	-
<b>Dependency:</b>	Refer to: r0034, p0604, p0605, p0606, p0611, p0615, p0625, p0626, p0627, p0628 Refer to: F07011, A07012, A07910				
<b>Note:</b>	Mot_temp_mod: motor temperature model Re bit 00: This bit is only used for permanent-magnet synchronous motors (p0300 = 2xx). It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero (p0611 > 0).				

Re bit 01:

This bit is used to activate/deactivate the motor temperature model for induction motors.

<b>p0615[0...n]</b>	<b>Mot_temp_mod 1 (I2t) fault threshold / I2t F thresh</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.0 [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 21_1 <b>Scaling:</b> - <b>Max</b> 220.0 [°C]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8017 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 180.0 [°C]
<b>Description:</b>	Sets the fault threshold for monitoring the motor temperature for motor temperature model 1 (I2t). - Fault F07911 is output after the fault threshold is exceeded.		
<b>Dependency:</b>	The parameter is only used for permanent-magnet synchronous motors (p0300 = 2xx). Refer to: r0034, p0611, p0612 Refer to: F07011, A07012		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The hysteresis is 2 K.		
<b>p0616[0...n]</b>	<b>Motor overtemperature alarm threshold 1 / Mot temp alarm 1</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.0 [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 21_1 <b>Scaling:</b> - <b>Max</b> 200.0 [°C]	<b>Access level:</b> 2 <b>Func. diagram:</b> 8016 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 130.0 [°C]
<b>Description:</b>	Sets the alarm threshold 1 for monitoring the motor temperature.		
<b>Note:</b>	The alarm threshold is not, as for p0604, coupled to the timer p0606. The hysteresis for canceling the fault is 2 K.		
<b>p0620[0...n]</b>	<b>Thermal adaptation, stator and rotor resistance / Mot therm_adapt R</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the thermal adaptation of the stator/primary section resistance and rotor/secondary section resistance according to r0395 and r0396.		
<b>Value:</b>	0: No thermal adaptation of stator and rotor resistances 1: Resistances adapted to the temperatures of the thermal model 2: Resistances adapted to the measured stator winding temperature		
<b>Note:</b>	For p0620 = 1, the following applies: The stator resistance is adapted using the temperature in r0035 and the rotor resistance together with the model temperature in r0633. For p0620 = 2, the following applies: The stator resistance is adapted using the temperature in r0035. If applicable, the rotor temperature for adapting the rotor resistance is calculated from the stator temperature (r0035) as follows: $\theta_{R} = (r0628 + r0625) / (r0627 + r0625) * r0035$ For separately-excited synchronous motors and p0620 = 1, p0620 = 2 is internally and automatically used for calculating. There is no thermal model to adapt the damping resistances.		

<b>p0621[0...n]</b>	<b>Identification stator resistance after restart / Rst_ident Restart</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> C2(3), T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	<p>Selects the identification of the stator resistance after booting the Control Unit (only for vector control).</p> <p>The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.</p> <p>p0621 = 1: Identification of the stator resistance only when the drive is powered up for the first time (pulse enable) after booting the Control Unit.</p> <p>p0621 = 2: Identification of the stator resistance every time the drive is powered up (pulse enable).</p>		
<b>Value:</b>	0: No Rs identification 1: Rs identification after switching-on again 2: Rs identification after switching-on each time		
<b>Dependency:</b>	<ul style="list-style-type: none"> <li>- perform motor data identification (see p1910) with cold motor.</li> <li>- enter ambient temperature at time of motor data identification in p0625.</li> </ul> Refer to: p0622, r0623		
<b>Notice:</b>	<p>The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.</p> <p>Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.</p>		
<b>Note:</b>	<p>The measurement is carried out:</p> <ul style="list-style-type: none"> <li>- For induction motors</li> <li>- When vector control is active (see p1300)</li> <li>- If a temperature sensor (KTY) has not been connected</li> <li>- When the motor is at a standstill when switched on</li> </ul> <p>When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure).</p> <p>If identification is activated, the magnetizing time is determined via p0622 and not via p0346. Quick magnetizing (p1401.6) is de-energized internally and alarm A07416 is displayed. The speed is enabled after completion of the measurement.</p>		
<b>p0622[0...n]</b>	<b>Motor excitation time for Rs_ident after powering up again / t_excit Rs_id</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0.000 [s]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 20.000 [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the excitation time of the motor for the stator resistance identification after powering up again (restart).		
<b>Dependency:</b>	Refer to: p0621, r0623		
<b>Note:</b>	<p>For p0622 &lt; p0346 the following applies:</p> <p>If identification is activated, the magnetizing time is influenced by p0622. The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current.</p>		

For p0622 >= p0346 the following applies:

Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. The entire measurement period (magnetizing plus measurement settling time plus measuring time) will always be greater than p0346.

<b>r0623</b>	<b>Stator resistance of Rs identification after powering up again / R_stator Rs-Id</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> - [ohm]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [ohm]	<b>Access level:</b> 4 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [ohm]
<b>Description:</b>	Displays the identified stator resistance after the Rs identification after powering up again.		
<b>Dependency:</b>	Refer to: p0621, p0622		
<b>p0624[0...n]</b>	<b>Motor temperature offset PT100 / Mot T_offset PT100</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -100.0 [K]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 21_2 <b>Scaling:</b> - <b>Max</b> 100.0 [K]	<b>Access level:</b> 3 <b>Func. diagram:</b> 8016 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [K]
<b>Description:</b>	Sets the temperature offset for the PT100 measured value. If there is a difference between the motor temperature displayed in r0035 and the actual motor temperature, this offset can be entered in this parameter, thereby compensating for the difference.		
<b>Dependency:</b>	Refer to: p0600, p0601, p0602		
<b>Note:</b>	The parameter only takes effect with the following settings: - Temperature sensor of the power unit detected (p0600 = 11). - Sensor type PT100 selected (p0601 = 5). If the resistance in series with the PT100 (e.g. the cable resistance of the feeder cable) is known, the following conversion formula must be used: Offset in p0624 = Measured resistance in ohms x 2.5 K/Ohm Example: Measured cable resistance = 2 Ohm --> 2 Ohm x 2.5 K / Ohm = 5.0 K		
<b>p0625[0...n]</b>	<b>Motor ambient temperature / Mot T_ambient</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> -40 [°C]	<b>Calculated:</b> CALC_MOD_EQU <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> 21_1 <b>Scaling:</b> - <b>Max</b> 80 [°C]	<b>Access level:</b> 3 <b>Func. diagram:</b> 8016 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 20 [°C]
<b>Description:</b>	Defines the ambient temperature of the motor for calculating the motor temperature model.		
<b>Note:</b>	The parameters for stator and rotor resistance (p0350, p0354) refer to this temperature. If the thermal I2t motor model is activated for permanent-magnet synchronous motors (refer to p0611), p0625 is included in the model calculation if a temperature sensor is not being used (see p0601).		

<b>p0626[0...n]</b>	<b>Motor overtemperature, stator core / Mot T<sub>over</sub> core</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T	<b>Calculated:</b> CALC_MOD_EQU	<b>Access level:</b> 3

<b>Dependency:</b>	Refer to: p0634		
<b>p0637[0...n]</b>	<b>Q flux flux gradient saturated / PSIQ Grad SAT</b>		
VECTOR_G	<b>Can be changed:</b> C2(3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> ASM, FEM <b>Min</b> 0.00 [mH]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.00 [mH]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [mH]
<b>Description:</b>	The non-linear and cross-coupled quadrature axis flux functions are defined using 4 coefficients. This parameter describes the gradients of the saturated component over the quadrature axis current.		
<b>Dependency:</b>	Refer to: p0634, p0635, p0636		
<b>p0640[0...n]</b>	<b>Current limit / Current limit</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 3), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.00 [Arms]	<b>Access level:</b> 2 <b>Func. diagram:</b> 5722, 6640 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the current limit.		
<b>Dependency:</b>	Refer to: r0209, p0323		
<b>Note:</b>	<p>The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305, p0323 and p0338.</p> <p>The current limit p0640 is limited to r0209 and p0323. The limit to p0323 is not realized if a value of zero is entered there.</p> <p>The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the Motor Module.</p> <p>The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 &gt; 0 or using the automatic parameterization with p0340 = 3, 5. For VECTOR the following applies (p0107):</p> <p>p0640 is limited to 4.0 x p0305.</p> <p>p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]).</p> <p>p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 &gt; 0).</p> <p>For SERVO the following applies (p0107):</p> <p>p0640 is pre-assigned as follows using the automatic parameterization (p0340 = 1, p3900 &gt; 0) taking into account the limits r0209 and r0323:</p> <ul style="list-style-type: none"> <li>- for induction motors: p0640 = 1.5 x p0305</li> <li>- for synchronous motors: p0640 = p0338</li> </ul>		

**p0641[0...n] CI: Current limit, variable / Curr lim var**

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0

**Description:** Sets the overvoltage protection for synchronous motors in the field-weakening range.

**Value:** 0: No measure  
1: Voltage Protection Module (VPM)

**Dependency:** Refer to: p0316, p1082, p1231, p9601, p9801  
Refer to: F07906, F07907

**Notice:** When the speed limiting is removed, the user is responsible for implementing a suitable overvoltage protection.

**Note:** In the field-weakening range, synchronous motors can, when a fault condition exists, generate high DC link voltages. The following possibilities exist to protect the drive system from being destroyed due to overvoltage:

- limit the maximum speed (p1082) without any additional protection.

The maximum speed without protection is calculated as follows:

Rotary motors:  $p1082 \text{ [rpm]} \leq 11.695 * r0297/p0316 \text{ [Nm/A]}$

Linear motors:  $p1082 \text{ [m/min]} \leq 73.484 * r0297/0316 \text{ [N/A]}$

- use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801).

When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" must be connected to the VPM.

- activating the internal voltage protection (IVP) with p1231 = 3.

**p0650[0...n] Actual motor operating hours / Mot t\_oper act**

**Description:** Runs the corresponding macro files.  
The binector inputs of the corresponding command data set are appropriately interconnected.  
The selected macro file must be available on the memory card/device memory.  
Example:  
p0700 = 6 --> macro file PM000006.ACX is run.

**Dependency:** Refer to: p0015, p1000, p1500, r8571

**Caution:** When executing a specific macro, the corresponding programmed settings are made and become active.

**Notice:** No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK\_IBN group!

**Note:** The macros in the specified directory are displayed in r8571. r8571 is not in the expert list of the commissioning software.  
Macros available as standard are described in the technical documentation of the particular product.

				<b>Not for motor type:</b> -		<b>Scaling:</b> -		<b>Expert list:</b> 1	
				<b>Min</b>		<b>Max</b>		<b>Factory setting</b>	
				0		1		0	
<b>Description:</b>				Sets the limit for a signal to be output via test sockets.					
<b>Value:</b>				0:      Limiting off 1:      Limiting on					

**Index:** [0] = T0  
[1] = T1  
[2] = T2

**Note:** Limiting on:  
If signals are output outside the permissible measuring range, the signal is limited to 4.98 V or to 0 V.  
Limiting off:  
If signals are output outside the permissible measuring range, this causes signal overflow. In the case of signal overflow, the signal jumps from 0 V to 4.98 V or from 4.98 V to 0 V.

---

**r0786[0...2] Test socket scaling per volt / TestSktScale/Volt**

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8134
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the scaling of the signal to be output.  
A change in the output voltage by 1 volt corresponds to the value in this parameter. The units are determined by the interconnected test signal.

**Index:** [0] = T0  
[1] = T1  
[2] = T2

**Dependency:** Refer to: p0771, r0772, r0774, p0777, p0778, p0779, p0780, p0783, p0784

**Note:** Example:  
r0786[0] = 1500.0 and the measuring signal is r0063 (CO: Actual speed smoothed [rpm]).  
A change of 1 V at the output of test socket T0 corresponds to 1500.0 [rpm].

	21	DI 21	(X132.6/X120.10)	Simulation	Terminal eval	-

**Dependency:** The setpoint for the input signals is specified using p0796.  
Refer to: p0796, p9620

**Notice:** If a digital input is used as signal source for the function "STO" (BI: p9620) then it is not permissible to select the simulation mode and this is rejected.

To the terminal designation:

The first designation stands for CU320, the second for CU310.

**Note:** This parameter is not saved when data is backed-up (p0971, p0977).  
 DI: Digital Input  
 DI/DO: Bidirectional Digital Input/Output

	12	Motor selection, bit 12	High	Low	-
	13	Motor selection, bit 13	High	Low	-
	14	Motor selection, bit 14	High	Low	-
	15	Motor selection, bit 15	High	Low	-

**Dependency:** Refer to: p0827

**p0831[0...15] BI: Motor changeover, contactor feedback / Mot\_chg cont fdbk**

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32 / Binary	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8575
	<b>P-Group:</b> Motor	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0

**Description:** Sets the signal source for the feedback signal of the contactors when changing over motors.  
There is a fixed inter-relationship between energizing the contactor and the feedback signal.  
Example:  
A changeover is to be made between MDS0 (motor 0) and MDS1 (motor 1). The contactors should be switched using bit 4 (contactor 0) and 5 (contactor 1). The changeover should be made with an interconnection of the feedback signal.  
Implementation:  
MDS0: p0827[0] = 4, interconnect output to switch contactor 0 to r0830.4, p0831[4] = "input, feedback signal, contactor 0"  
MDS1: p0827[1] = 5, interconnect output to switch contactor 1 to r0830.5, p0831[5] = "input, feedback signal, contactor 1"  
The following sequence applies when changing over from MDS0 to MDS1:  
1. The status bit r0830.4 is deleted. When the feedback signal (p0831[4]) is connected, the system waits until the feedback signal "contactor open" is displayed. If the feedback signal is not connected, then the system waits for the switch-off interlocking time of 320 ms.  
2. The status bit r0830.5 is set. If the feedback signal (p0831[5]) is connected, the system waits until the feedback signal "contactor closed" is displayed. If the feedback signal is not connected, then the system waits for the switch-on interlocking time of 160 ms.

<b>Index:</b>	[0] = Feedback signal contactor 0

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0010 bin

**Description:** Sets the configuration for the motor and encoder changeover.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Contactor changeover from the application/drive	application	Drive	-
	01	Pulse suppression by application/drive	application	Drive	-
	02	Suppress drive parking for EDS changeover	Yes	No	-

**Note:** Re bit 00:  
When the bit is set and the motor has to be changed over, then p0827 must be set differently in the appropriate motor data sets.  
Re bit 02:  
The bit defines whether, for an EDS changeover, the status signal Gn\_ZSW.14 is suppressed (parking encoder active).  
Re motor changeover to running motor:  
The "flying restart" function should also be activated (p1200) when changing over to a motor that is already running.

VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8575
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the status word for the drive data set changeover.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Motor changeover active	Yes	No	8575
	01	Encoder changeover active	Yes	No	-
	02	Internal parameter calculation active	Yes	No	-
	04	Armature short circuit active	Yes	No	-
	05	Identification running	Yes	No	-
	06	Friction characteristic record running	Yes	No	-
	07	Rotating measurement running	Yes	No	-
	08	Motor data identification running	Yes	No	-
	10	Wait for pulse suppression	Yes	No	-
	11	Wait for motor changeover feedback signal	Yes	No	-

**Note:** This parameter is only supplied with up-to-date values if data set changeover has been selected or is running.  
Re bit 00:  
The signal is only influenced when a motor changeover is set via p0827 (unequal bit numbers).  
Re bit 01:  
The signal is only influenced when an encoder changeover is set via p0187, p0188, or p0189.  
Re bit 02:  
A data set changeover is delayed by the time required for the internal parameter calculation.  
Re bit 04:  
A data set changeover is only carried out when the armature short circuit is not activated.  
Re bit 05:  
The following applies for SERVO:  
A data set changeover is only carried out when pole position identification, encoder adjustment, motor data identification, and rotating measurement are not running.

The following applies for VECTOR:

A data set changeover is only carried out when pole position identification is not running.

Re bit 06:

A data set changeover is only carried out when the friction characteristic record is not running.

Re bit 07 (VECTOR only):

A data set changeover is only carried out when rotating measurement is not running.

Re bit 08 (VECTOR only):

A data set changeover is only carried out when motor data identification is not running.

Re bit 10:

A motor changeover is set with p0833.1 = 1. It can only be carried out when the application performs pulse suppression.

Re bit 11:

A motor changeover is set with p0833.0 = 1. The pulses are only enabled when the "Motor changeover feedback" signal is detected.

<b>Dependency:</b>	Refer to: r0049, p0186, p0187, p0188, p0189		
<b>Note:</b>	Value 99 means the following: No encoder assigned (not configured).		
<b>p0839</b>	<b>Motor changeover contactor control delay time / Mot_chg ctrl t_del</b>		
VECTOR_G	<b>Can be changed:</b> C2(3) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 500 [ms]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0 [ms]
<b>Description:</b>	Sets the delay time for the contactor control for the motor changeover.		
<b>Note:</b>	The delay time is taken into account in the following cases: - for feedback signal, previous contactor "Open". The new motor contactor is controlled (energized) after the delay time has expired. - for the feedback signal, new motor contactor "Closed". The pulses are enabled after the delay time has expired.		
<b>p0840[0...n]</b>	<b>BI: ON / OFF (OFF1) / ON / OFF (OFF1)</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / Binary  <b>P-Group:</b> Commands <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 2501, 2610, 8720, 8820, 8920 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the command "ON/OFF (OFF1)". For the PROFIdrive profile, this command corresponds to control word 1 bit 0 (STW1.0).		
<b>Recommend.:</b>	When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.		
<b>Dependency:</b>	Refer to: p1055, p1056		
<b>Caution:</b>	When "master control from PC" is activated, this binector input is ineffective.		
			
<b>Notice:</b>	For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056. The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056. For binector input p0840 = 0 signal, the switch-on inhibit is acknowledged. Only the signal source that originally powered up can also power down again. The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<b>Note:</b>	For drives with closed-loop speed control (p1300 = 20, 21), the following applies: - BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse suppression)		

For drives with closed-loop torque control (p1300 = 22, 23), the following applies:

- BI: p0840 = 0 signal: immediate pulse suppression

For drives with closed-loop torque control (activated using p1501), the following applies:

- BI: p0840 = 0 signal: No dedicated braking response, but pulse cancelation when standstill is detected (p1226, p1227)

For drives with closed-loop speed/torque control, the following applies:

- BI: p0840 = 0/1 signal: ON (pulses can be enabled)

For active infeeds (Active Line Module and Smart Line Module) the following applies:

- BI: p0840 = 0 signal: OFF1 (reduce Vdc along the ramp, then pulse suppression and pre-charging contactor/line contactor open)

- BI: p0840 = 0/1 signal: ON (pre-charging contactor/line contactor close, pulses can be enabled)

For passive infeeds (Basic Line Module) the following applies:

- BI: p0840 = 0 signal: OFF1 (pre-charging contactor/line contactor open)

- BI: p0840 = 0/1 signal: ON (pre-charging contactor/line contactor close)

r0863.1 of a drive can also be selected as signal source.

<b>p0844[0...n]</b>	<b>BI: No coast-down / coast-down (OFF2) signal source 1 / OFF2 S_src 1</b>

	-	-	1
<b>Description:</b>	Sets the signal source for the command "enable speed controller" (r0898.12). 0 signal: Set the I component and speed controller output to zero. 1 signal: Enable speed controller.		
<b>Dependency:</b>	Refer to: r0898		
<b>Note:</b>	If "enable speed controller" is withdrawn, then an existing brake will be closed. If "speed controller enable" is withdrawn, the pulses are not suppressed.		

<b>p0857</b>	<b>Power unit monitoring time / PU t_monit</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8760, 8864, 8964
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	100.0 [ms]	60000.0 [ms]	6000.0 [ms]
<b>Description:</b>	Sets the monitoring time for the power unit.		

The following applies for infeeds and drives:

The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, then fault F06000 (infeeds) or F07802 (drives) is output.

For drives, the following also applies:

After the pulse enable (operation enabled, p0852), the monitoring time is re-started. If the infeed does not signal ready to the drive within the monitoring time (using BI: p0864 of the drive), fault F07840 is initiated.

**Dependency:** Refer to: F06000, F07802, F07840, F30027

**Notice:** The maximum time to pre-charge the DC link is monitored in the power unit and cannot be changed. The maximum duration of the pre-charging depends on the power class and the power unit design.

The monitoring time for the pre-charging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum pre-charging duration is exceeded.

**Note:** The factory setting for p0857 depends on the power class and the design of the power unit.

The monitoring time for the ready signal of the power unit includes the time to pre-charge the DC link and, if relevant, the de-bounce time of the contactors.

If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

<b>p0858[0...n]</b>	<b>BI: Unconditionally close holding brake / Uncond close brake</b>		
VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned32 / Binary	<b>Dynamic index:</b> CDS, p0170	<b>Func. diagram:</b> 2501, 2701, 2707
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0
<b>Description:</b>	Sets the signal source for the command "unconditionally close holding brake".		
<b>Dependency:</b>	Refer to: p0855		
<b>Note:</b>	The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake). For a 1 signal via BI: p0858, the command "unconditionally close the holding brake" is executed and internally a zero setpoint is entered.		

<b>p0860</b>	<b>BI: Line cont. fdbk sig / Line contact feedb</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32 / Binary	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2634, 8734, 8834, 8934
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	863.1
<b>Description:</b>	Sets the signal source for the feedback signal from the line contactor.		
<b>Recommend.:</b>	When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used.		
<b>Dependency:</b>	Refer to: p0861, r0863 Refer to: F07300		
<b>Notice:</b>	The line contactor monitoring is de-activated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1).		
<b>Note:</b>	The state of the line contactor is monitored depending on signal BO: r0863.1. When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1.		

---

	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0 [ms]	<b>Max</b> 5000 [ms]	<b>Factory setting</b> 100 [ms]
<b>Description:</b>	Sets the monitoring time of the line contactor. This time starts each time that the line contactor switches (r0863.1). If a feedback signal is not received from the line contactor within the time, a message is output.		
<b>Dependency:</b>	Refer to: p0860, r0863 Refer to: F07300		
<b>Note:</b>	The monitoring function is disabled for the factory setting of p0860.		

---

### p0862 Power unit ON delay / PU t\_on

B_INF, VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2610, 8732, 8832, 8932
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0 [ms]	<b>Max</b> 65000 [ms]	<b>Factory setting</b> 0 [ms]
<b>Description:</b>	Sets the delay time for the control command of the power unit and a line contactor, if used.		
<b>Note:</b>	This means that it is possible to realize a shifted (delayed) pre-charging or power-on using a single ON command. When the infeed units are active, before the line contactor is closed, an offset adjustment of the current measurement is carried out for a duration of 120 ms (p3491).		

---

### r0863.0...2 CO/BO: Drive coupling status word/control word / CoupleZSW/STW

B_INF, VECTOR_G	<b>Can be changed:</b> -		<b>Calculated:</b> -	<b>Access level:</b> 2	
	<b>Data type:</b> Unsigned16		<b>Dynamic index:</b> -	<b>Func. diagram:</b> -	
	<b>P-Group:</b> Commands		<b>Units group:</b> -	<b>Unit selection:</b> -	
	<b>Not for motor type:</b> -		<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> -		
<b>Description:</b>	Displays the status and control words of the drive coupling.				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Closed-loop control operation	Yes	No	2610, 6495, 8732, 8832, 8932, 9794
	01	Energize contactor	Yes	No	2610, 2634, 8732, 8734, 8832, 8834, 8932, 8934
	02	Infeed line supply failure	Yes	No	-
<b>Dependency:</b>	Refer to: p0864				

**Note:** Re bit 00:  
 Bit 0 signals that the infeed is ready.  
 When the operating signal is transferred via BO: r0863.0 this allows several drives to start (run-up) staggered over time when they are simultaneously powered up.  
 To realize this, the following connections/interconnections are required:  
 Drive 1: Interconnect BI: p0864 with BO: r0863.0 of the infeed  
 Drive 2: Interconnect BI: p0864 with BO: r0863.0 of drive 1  
 Drive 3: Interconnect BI: p0864 with BO: r0863.0 of drive 2, etc.  
 The first drive only transfers the operating signal to the next drive after it has reached its ready condition.  
 Re bit 01:  
 Bit 1 is used to control an external line contactor.  
 Re bit 02:  
 This bit only signals line supply failure for Active Infeed (A\_INF) and Smart Infeed (S\_INF).

<b>p0864</b>	<b>BI: Infeed operation / INF operation</b>		
VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned32 / Binary	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1773, 1774, 2610
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0
<b>Description:</b>	Sets the signal source for the operating signal of the infeed (e.g. BO: r0863.0).		
<b>Dependency:</b>	Refer to: r0863		
<b>Note:</b>	The sequence control of a servo/vector drive requires this signal. The following applies for an infeed without DRIVE-CLiQ: For these infeeds, the "ready" message is available via an output terminal. This signal must be connected to a digital input. The drives supplied from this infeed must use this signal as ready signal (BI: p0864 = digital input).		

<b>p0868</b>	<b>Power unit DC switch debounce time / PU DC sw t_deboun</b>		
VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3

126

126

**Description:**

Displays or sets the PROFIBUS address for PROFIBUS interface on the Control Unit.

The address can be set as follows:

1) Using the address switch on the Control Unit.

--> p0918 can then only be read and displays the selected address.

--> A change only becomes effective after a POWER ON.

2) Using p0918

--> Only if the address 00 hex, 7F hex, 80 hex, or FF hex has been set using the address switch.

--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".

--> A change only becomes effective after a POWER ON.

**Note:**

Permissible PROFIBUS addresses: 1 ... 126 (01 hex ... 7E hex)

Address 126 is used for commissioning.

Every PROFIBUS address change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

**Value:**

370: SIEMENS telegram 370, PZD-1/1

371: SIEMENS telegram 371, PZD-5/8

999: Free telegram configuration with BICO

**Dependency:**

Refer to: F01505, F01506

**Note:**

If a value is not equal to 999, a telegram is set and the automatically set interconnections in the telegram are inhibited.

The inhibited interconnections can only be changed again after setting value 999.

 2: Closed-loop position controlled operation  
 3: Closed-loop speed controlled operation without ramp-function generator

---

**r0944 CO: Counter for fault buffer changes / Fault buff change**

---

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8060
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays fault buffer changes. This counter is incremented every time the fault buffer changes.

**Recommend.:** Used to check whether the fault buffer has been read out consistently.

**Dependency:** Refer to: r0945, r0947, r0948, r0949, r2109

---

**r0945[0...63] Fault code / Fault code**

---

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8060
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the numbers of faults that have occurred.

**Dependency:** Refer to: r0947, r0948, r0949, r2109, r2130, r2133, r2136, r3120, r3122

**Notice:** The properties of the fault buffer should be taken from the corresponding product documentation.

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

Fault buffer structure (general principle):

r0945[0], r0949[0], r0948[0], r2109[0], r3115[0] --> actual fault case, fault 1

...

r0945[7], r0949[7], r0948[7], r2109[7], r3115[7] --> actual fault case, fault 8

r0945[8], r0949[8], r0948[8], r2109[8], r3115[8] --> 1st acknowledged fault case, fault 1

...

r0945[15], r0949[15], r0948[15], r2109[15], r3115[15] --> 1st acknowledged fault case, fault 8

...

r0945[56], r0949[56], r0948[56], r2109[56], r3115[56] --> 7th acknowledged fault case, fault 1

...

r0945[63], r0949[63], r0948[63], r2109[63], r3115[63] --> 7th acknowledged fault case, fault 8

**r0946[0...65534] Fault code list / Fault code list**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8060
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 0
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Lists the fault codes stored in the drive unit.  
The indices can only be accessed with a valid fault code.

**Dependency:** The parameter assigned to the fault code is entered in r0951 under the same index.

**r0947[0...63] Fault number / Fault number**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8060
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** This parameter is identical to r0945.

**r0948[0...63] Fault time received in milliseconds / t\_fault recv ms**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8060
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [ms]	- [ms]	- [ms]

**Description:** Displays the system runtime in milliseconds when the fault occurred.

**Dependency:** Refer to: r0945, r0947, r0949, r2109, r2114, r2130, r2133, r2136, r3115, r3120, r3122

**Notice:** The time comprises r2130 (days) and r0948 (milliseconds).

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the fault buffer and the assignment of the indices is shown in r0945.

When the parameter is read via PROFIdrive, the TimeDifference data type applies.

**r0949[0...63] Fault value / Fault value**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8060
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays additional information about the fault that occurred (as integer number).

**Dependency:** Refer to: r0945, r0947, r0948, r2109, r2130, r2133, r2136, r3115, r3120, r3122

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the fault buffer and the assignment of the indices is shown in r0945.

<b>p0952</b>	<b>Fault cases, counter / Fault cases qty</b>

<b>Description:</b>	Displays the device identification.		
<b>Index:</b>	[0] = Company (Siemens = 42) [1] = Device type [2] = Firmware version [3] = Firmware date (year) [4] = Firmware date (day/month) [5] = Number of drive objects [6] = Firmware patch/hot fix		
<b>Note:</b>	Example: r0964[0] = 42 --> SIEMENS r0964[1] = device type, see below r0964[2] = 403 --> first part of the firmware version V04.03 (for second part, refer to index 6) r0964[3] = 2010 --> year 2010 r0964[4] = 1705 --> 17th of May r0964[5] = 2 --> 2 drive objects r0964[6] = 200 --> second part, firmware version (complete version: V04.03.02.00)		

Device type:

r0964[1] = 5200 --> SINAMICS G150 CU320(-2 DP)

r0964[1] = 5201 --> SINAMICS G150 CU320-2 PN

r0964[1] = 5210 --> SINAMICS G130 CU320(-2 DP)

r0964[1] = 5211 --> SINAMICS G130 CU320-2 PN

<b>r0965</b>	<b>PROFIdrive profile number / PD profile number</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> - <b>Data type:</b> Unsigned16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the PROFIdrive profile number and profile version. Constant value = 0329 hex. Byte 1: Profile number = 03 hex = PROFIdrive profile Byte 2: Profile version = 29 hex = Version 4.1		
<b>Note:</b>	When the parameter is read via PROFIdrive, the Octet String 2 data type applies.		
<b>p0969</b>	<b>System runtime relative / t_System relative</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4294967295 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 1750, 8060 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0 [ms]
<b>Description:</b>	Displays the system runtime in ms since the last POWER ON.		
<b>Note:</b>	The value in p0969 can only be reset to 0. The value overflows after approx. 49 days. When the parameter is read via PROFIdrive, the TimeDifference data type applies.		
<b>p0970</b>	<b>Reset infeed parameter / INF par reset</b>		
B_INF	<b>Can be changed:</b> C2(30) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Factory settings <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	The parameter is used to initiate a reset of the parameters of an individual infeed unit. The parameters of the basic commissioning (refer to p0009) are in this case not reset (p0107, p0108, p0121, p0170). These can only be reset using the factory setting of the complete drive unit (p0976). The sampling times (p0111, p0112, p0115) are only not reset if this results in a conflict with the basic clock cycle (p0110).		
<b>Value:</b>	0: Inactive 1: Start a parameter reset 100: Start a BICO interconnection reset		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
<b>Note:</b>	A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset has been completed if p0970 and p0010 have been set to 0.		

**p0970      ENCODER reset parameters / ENC par reset**

ENC	<b>Can be changed:</b> C2(30)	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Factory settings	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	100	0

**Description:** The parameter is used to initiate the reset of the parameters on the ENCODER drive object.  
Parameter p0141 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976).

**Value:** 0: Inactive  
1: Start a parameter reset  
100: Start a BICO interconnection reset

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).  
At the end of the calculations, p0970 is automatically set to 0.  
Parameter reset has been completed if p0970 and p0010 have been set to 0.

**p0970      TB30 reset parameters / TB30 par reset**

TB30	<b>Can be changed:</b> C2(30)	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Factory settings	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	100	0

**Description:** The parameter is used to initiate a reset of the parameters on Terminal Board 30 (TB30).  
The sampling time p4099 is not reset if in so doing a conflict occurs with the basic clock cycle.  
Parameter p0161 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976).

**Value:** 0: Inactive  
1: Start a parameter reset  
100: Start a BICO interconnection reset

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).  
At the end of the calculations, p0970 is automatically set to 0.  
Parameter reset has been completed if p0970 and p0010 have been set to 0.

**p0970      TM150 reset parameters / TM150 par reset**

TM150	<b>Can be changed:</b> C2(30)	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Factory settings	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	100	0

**Description:** The parameter is used to initiate a reset of the parameters on Terminal Module 150 (TM150).

**Value:** 0: Inactive  
1: Start a parameter reset  
100: Start a BICO interconnection reset

**Dependency:** Refer to: p0010

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).  
At the end of the calculations, p0970 is automatically set to 0.

<b>p0970 TM31 reset parameters / TM31 par reset</b>			
TM31	<b>Can be changed:</b> C2(30) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Factory settings <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	The parameter is used to initiate a reset of the parameters on Terminal Module 31 (TM31). The sampling time p4099 is not reset if in so doing a conflict occurs with the basic clock cycle. Parameter p0151 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976).		
<b>Value:</b>	0: Inactive 1: Start a parameter reset 100: Start a BICO interconnection reset		
<b>Dependency:</b>	Refer to: p0010		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
<b>Note:</b>	A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0.		
<hr/>			
<b>p0970 TM54F reset parameters / TM54F par reset</b>			
TM54F_MA	<b>Can be changed:</b> C2(30) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Factory settings <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	The parameter is used to initiate a reset of the parameters on Terminal Module 54F (TM54F). Parameter p0151 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976).		
<b>Value:</b>	0: Inactive 1: Start a parameter reset 5: Starts a safety parameter reset 100: Start a BICO interconnection reset		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
<b>Note:</b>	A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset has been completed if p0970 and p0010 have been set to 0. For p0970 = 5 the following applies: The password for Safety Integrated must be set. When Safety Integrated is enabled, this can result in error messages, which then require an acceptance test to be performed. Then save the parameters and carry out a POWER ON.		
<hr/>			
<b>p0970 Reset drive parameters / Drive par reset</b>			
VECTOR_G	<b>Can be changed:</b> C2(30) <b>Data type:</b> Unsigned16 <b>P-Group:</b> Factory settings <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	The parameter is used to initiate the reset of the parameters of an individual drive unit.		

Parameters p0100, p0205 (only for VECTOR) and the parameters of the basic drive commissioning (p0009) are not reset (p0107, p0108, p0111, p0112, p0115, p0121, p0130, p0131, p0140, p0141, p0142, p0170, p0186 ... p0189). These can only be reset using the factory setting of the complete drive unit (p0976).

**Value:**

0:	Inactive
1:	Start a parameter reset
5:	Starts a safety parameter reset
100:	Start a BICO interconnection reset

**Dependency:** Refer to: F01659

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).

At the end of the calculations, p0970 is automatically set to 0.

Parameter reset has been completed if p0970 and p0010 have been set to 0.

For p0970 = 5 the following applies:

The password for Safety Integrated must be set.

When Safety Integrated is enabled, this can result in error messages, which then require an acceptance test to be performed.

Then save the parameters and carry out a POWER ON.

For p0970 = 1 the following applies:

If a Safety Integrated function is parameterized (p9601), then the safety parameters are not reset. In this case, a fault F01659 is output with fault value 2.

---

### p0971 Save drive object parameters / Drv\_obj par save

All objects

**Can be changed:** U, T

**Calculated:** -

**Access level:** 1

**Data type:** Unsigned16

**Dynamic index:** -

**Func. diagram:** -

**P-Group:** Factory settings

**Units group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

1

0

**Description:** Setting to save the parameter of the particular drive object in the non-volatile memory.

**Value:**

0:	Inactive
1:	Save drive object

**Dependency:** Refer to: p0977, p1960, p3845, r3996

**Caution:** The Control Unit power supply may only be powered down after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).

**Notice:** Writing to parameters is inhibited while saving.

The progress while saving is displayed in r3996.

**Note:** Starting from the particular drive object, the following parameters are saved:

CU3xx: Device-specific parameters and PROFIBUS device parameters.

Other objects: Parameters of the actual object and PROFIBUS device parameters.

Prerequisite:

In order that the parameter of a drive object, saved with p0971 = 1, is read the next time that the Control Unit is booted, then all parameters must, as a minimum, have first been saved once with p0977 = 1.

---

### p0972 Drive unit reset / Drv\_unit reset

0

3

0

**Description:** Sets the required procedure to execute a hardware reset for the drive unit.

**Value:**

0:	Inactive
1:	Hardware-Reset immediate

**Danger:**

**Note:**

2: Hardware reset preparation  
3: Hardware reset after cyclic communication has failed  
It must be absolutely ensured that the system is in a safe condition.  
The memory card/device memory of the Control Unit must not be accessed.

If value = 1:  
Reset is immediately executed and communications interrupted.  
After communications have been established, check the reset operation (refer below).  
If value = 2:  
Help to check the reset operation.  
Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.  
After communications have been established, check the reset operation (refer below).  
If value = 3:  
The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.  
If cyclic communication is not active, then the reset is immediately executed.  
If the cyclic communication is active for both PROFIdrive interfaces, then the reset is executed after completing both cycle communications.  
After communications have been established, check the reset operation (refer below).  
To check the reset operation:  
After the drive unit has been restarted and communications have been established, read p0972 and check the following:  
p0972 = 0? --> The reset was successfully executed.  
p0972 > 0? --> The reset was not executed.

0

1013

0

**Description:**

Resets or downloads all parameters of the drive system.

**Value:**

- 0: Inactive
- 1: Start reset of all parameters to factory setting
- 2: Start dnlod of param. saved in non-volatile mem w/ p0977=1
- 3: Start dnlod of volatile parameters from RAM
- 10: Start dnlod of param. saved in non-volatile mem w/ p0977=10
- 11: Start dnlod of param. saved in non-volatile mem w/ p0977=11
- 12: Start dnlod of param. saved in non-volatile mem w/ p0977=12
- 20: Start download Siemens internal setting 20
- 21: Start download Siemens internal setting 21
- 22: Start download Siemens internal setting 22
- 23: Start download Siemens internal setting 23
- 24: Start download Siemens internal setting 24
- 25: Start download Siemens internal setting 25
- 26: Start download Siemens internal setting 26
- 100: Start resetting of all BICO interconnections
- 1011: Start dnlod of param. saved in volatile mem w/ p0977=1011
- 1012: Start dnlod of param. saved in volatile mem w/ p0977=1012
- 1013: Start dnlod of param. saved in volatile mem w/ p0977=1013

**Notice:**

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**

After all of the parameters have been reset to their factory setting, the system must be commissioned for the first time again.

Resetting or loading is realized in the non-volatile memory.

Procedure:

1. Set p0009 = 30 (parameter reset).
2. Set p0976 to "required value". The system is rebooted.

p0976 is automatically set to 0 and p0009 is automatically set to 1 after this has been carried out.

### p0978[0...24] List of drive objects / List of the DO

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> C1(1)	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned8	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Topology	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	255	[0] 1 [1...24] 0

<b>Description:</b>	<p>This parameter is an image of p0101 in conformance with PROFIdrive.</p> <p>Parameters p0101 and p0978 contain the following information:</p> <ol style="list-style-type: none"> <li>1) The same number of drive objects</li> <li>2) The same drive objects</li> </ol> <p>In this sense, they are consistent.</p> <p>Difference between p0101 and p0978:</p> <p>p0978 can be re-sorted and a zero inserted in order to identify those drive objects that participate in the process data exchange and to define their sequence in the process data exchange. Drive objects that are listed after the first zero, are excluded from the process data exchange.</p> <p>For p0978, in addition, the value 255 can be inserted a multiple number of times.</p> <p>p0978[n] = 255 means: The drive object is visible for the PROFIBUS master and is empty (without any actual process data exchange). This allows cyclic communications of a PROFIBUS master with unchanged configuring to the drive units with a lower number of drive objects.</p>
<b>Dependency:</b>	Refer to: p0101, p0971, p0977
<b>Note:</b>	p0978 cannot be changed when the drive system is first commissioned. The reason for this is that at this time the actual topology has still not been acknowledged (p0099 is still not equal to r0098 and p0009 is set to 0).

### r0979[0...10] PROFIdrive encoder format / PD encoder format

**Dependency:** Refer to: r0990, r0991

**Note:** Modified parameters are displayed in indices 0 to 98. If an index contains the value 0, then the list ends here.

This list consists solely of the following parameters:

r0990[0...99], r0991[0...99] ... r0999[0...99]

The parameters in this list are not displayed in the expert list of the commissioning software. However, they can be read from a higher-level control system (e.g. PROFIBUS master).

**p1000[0...n] Macro Connector Inputs (CI) for speed setpoints / Macro CI n\_set**

VECTOR_G	<b>Can be changed:</b> C2(1), T	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> CDS, p0170	<b>Func. diagram:</b> -
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	999999	0

**Description:** Runs the corresponding macro files.

The Connector Inputs (CI) for the speed setpoints of the appropriate Command Data Set (CDS) are appropriately interconnected.

The selected macro file must be available on the memory card/device memory.

Example:

p1000 = 6 --> the macro file PM000006.ACX is run.

**Dependency:** Refer to: p0015, p0700, p1500, r8572

**Caution:** When executing a specific macro, the corresponding programmed settings are made and become active.

**Notice:** No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK\_IBN group!

**Note:** The macros in the specified directory are displayed in r8572. r8572 is not in the expert list of the commissioning software.

Macros available as standard are described in the technical documentation of the particular product.

CI: Connector Input

<b>Description:</b>	Displays the selected and effective fixed speed setpoint.  This setpoint is the output value for the fixed speed setpoints and must be appropriately interconnected (e.g. with the main setpoint).		

**Recommend.:** Interconnect the signal with main setpoint (p1070).  
**Dependency:** Selects the required fixed speed setpoint using p1020 ... p1023.  
 Displays the number of the actual fixed speed setpoint in r1197.  
 Sets the values for the fixed speed setpoints 1 ... 15 using p1001 ... p1015.  
 Refer to: p1070, r1197  
**Note:** If a fixed speed setpoint has not been selected (p1020 ... p1023 = 0, r1197 = 0), then r1024 = 0 (setpoint = 0).

### p1030[0...n] Motorized potentiometer configuration / Mop configuration

<b>VECTOR_G</b>	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 3020
	<b>P-Group:</b> Setpoints	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 0110 bin

**Description:** Sets the configuration for the motorized potentiometer.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Data save active	Yes	No	-
	01	Automatic mode, ramp-function generator active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Save in NVRAM active	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-

**Notice:** The following prerequisites must be fulfilled in order to be able to save the setpoint (Bit 03 = 1) in a non-volatile fashion:

- Firmware with V2.3 or higher.
- Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).

**Note:**

Re bit 00:  
 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.  
 1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.

Re bit 01:  
 0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).  
 1: With ramp-function generator in the automatic mode.  
 For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.

Re bit 02:  
 0: Without initial rounding-off  
 1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).  
 The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:  

$$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$$
  
 The jerk acts up until the maximum acceleration is reached ( $a_{max} = p1082 [1/s] / p1047 [s]$ ), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:  
 0: Non-volatile data save de-activated.  
 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

Re bit 04:  
 When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

<b>p1035[0...n]</b>	<b>BI: Motorized potentiometer setpoint raise / Mop raise</b>

<b>p1080[0...n]</b>	<b>Minimum speed / n_min</b>		
VECTOR_G	<b>Can be changed:</b> C2(1), T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0.000 [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 3_1 <b>Scaling:</b> - <b>Max</b> 19500.000 [rpm]	<b>Access level:</b> 1 <b>Func. diagram:</b> 3050 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [rpm]
<b>Description:</b>	Sets the lowest possible motor speed. This value is not undershot in operation.		
<b>Dependency:</b>	Refer to: p1106		
<b>Notice:</b>	The effective minimum speed is formed from p1080 and p1106.		
<b>Note:</b>	The parameter value applies for both motor directions. In exceptional cases, the motor can operate below this value (e.g. when reversing).		

<b>p1082[0...n]</b>	<b>Maximum speed / n_max</b>		
VECTOR_G	<b>Can be changed:</b> C2(1), T	<b>Calculated:</b> CALC_MOD_ALL	<b>Access level:</b> 1
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 3020, 3050, 3060, 3070, 3095, 5300
	<b>P-Group:</b> Setpoints	<b>Units group:</b> 3_1	<b>Unit selection:</b> p0505
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.000 [rpm]	<b>Max</b> 210000.000 [rpm]	<b>Factory setting</b> 1500.000 [rpm]
<b>Description:</b>	Sets the highest possible speed.		
<b>Dependency:</b>	<p>For vector control (p1300 = 20 ... 23) the maximum speed is limited to 60.0 / (8.333 * p0115[0] * r0313). This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.</p> <p>If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.</p> <p>For reactors and dU/dt filters, it is limited to 150 Hz * 60 / r0313 (for chassis power units) or 120 Hz * 60 / r0313 (for booksize power units).</p> <p>Refer to: p0115, p0230, r0313, p0322, p0324, r0336, p0532</p>		
<b>Notice:</b>	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
<b>Note:</b>	<p>The parameter applies for both motor directions.</p> <p>The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer).</p> <p>Since the parameter is part of quick commissioning (p0010 = 1), it is defined appropriately when p0310, p0311, p0322, p0324, p0530, p0531, and p0532 are changed.</p> <p>The following limits are always effective for p1082:</p> <p><math>p1082 \leq \min(p0324, p0532)</math> if <math>p0324 &gt; 0</math> and <math>p0532 &gt; 0</math></p> <p><math>p1082 \leq p0322</math> if <math>p0324 = 0</math> or <math>p0532 = 0</math> and <math>p0322 &gt; 0</math></p> <p><math>p1082 \leq 60 * \text{Minimum} (15 * r0336, 650 \text{ Hz}) / r0313</math></p> <p><math>p1082 \leq 60 * \text{Maximum power unit pulse frequency} / (k * r0313)</math></p> <p><math>k = 12</math> for vector control (<math>r0108.2 = 1</math>), <math>k = 6.5</math> for U/f control (<math>r0108.2 = 0</math>)</p> <p>For the automatic calculation (p0340 = 1) the value of the parameter is pre-assigned the maximum motor speed (p0322). If p0322 = 0, the rated motor speed (p0311) is used as default (pre-assignment) value. For induction motors that are not catalog motors (p0301 = 0), the synchronous no-load speed is used as default (pre-assignment) value (<math>p0310 * 60 / r0313</math>).</p> <p>For synchronous motors, the following additionally applies:</p> <p>The maximum speed p1082 is restricted to speeds (r1084) where the EMF does not exceed the DC link voltage.</p> <p>The effective assignment of the motor data set parameter (e.g. p0311) to the drive data set parameter p1082 when pre-assigning should be taken from p0186.</p> <p>p1082 is also available in the quick commissioning (p0010 = 1); this means that when exiting via p3900 &gt; 0, the value is not changed.</p>

<b>Description:</b>	Displays the setpoint at the input of the ramp-function generator.		
<b>Notice:</b>	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<b>Note:</b>	The setpoint is influenced by other functions, e.g. skip (suppressed) speeds, minimum and maximum limits.		
<b>p1120[0...n]</b>	<b>Ramp-function generator ramp-up time / RFG ramp-up time</b>		
VECTOR_G	<b>Can be changed:</b> C2(1), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 999999.000 [s]	<b>Access level:</b> 1 <b>Func. diagram:</b> 3060, 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 10.000 [s]
<b>Description:</b>	The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.		
<b>Dependency:</b>	Refer to: p1082, p1138		
<b>Note:</b>	The ramp-up time can be scaled via connector input p1138. The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized. For U/f control and sensorless vector control (see p1300), ramp-up times of 0 s are not expedient. The setting should be based on the startup times (r0345) of the motor.		
<b>p1121[0...n]</b>	<b>Ramp-function generator ramp-down time / RFG ramp-down time</b>		
VECTOR_G	<b>Can be changed:</b> C2(1), U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 999999.000 [s]	<b>Access level:</b> 1 <b>Func. diagram:</b> 3060, 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 10.000 [s]
<b>Description:</b>	The ramp-function generator ramps-down the speed setpoint from the maximum speed (p1082) down to standstill (setpoint = 0) in this time. Further, the ramp-down time is always effective for OFF1.		
<b>Dependency:</b>	Refer to: p1082, p1139		
<b>Note:</b>	For U/f control and sensorless vector control (see p1300), ramp-down times of 0 s are not recommended. The setting should be based on the startup times (r0345) of the motor.		
<b>p1122[0...n]</b>	<b>BI: Bypass ramp-function generator / Bypass RFG</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 / Binary <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 2505 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for bypassing the ramp generator (ramp-up and ramp-down times = 0).		
<b>Notice:</b>	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<b>Note:</b>	For VECTOR in encoderless operation, it is not permissible that the ramp-function generator is bypassed.		

<b>p1130[0...n]</b>	<b>Ramp-function generator initial rounding-off time / RFG t_start_round</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 30.000 [s]	<b>Access level:</b> 2 <b>Func. diagram:</b> 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the initial rounding-off time for the extended ramp generator. The value applies to ramp-up and ramp-down.		
<b>Note:</b>	Rounding-off times avoid an abrupt response and prevent damage to the mechanical system.		
<b>p1131[0...n]</b>	<b>Ramp-function generator final rounding-off time / RFG t_end_delay</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 30.000 [s]	<b>Access level:</b> 2 <b>Func. diagram:</b> 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the final rounding-off time for the extended ramp generator. The value applies to ramp-up and ramp-down.		
<b>Note:</b>	Rounding-off times avoid an abrupt response and prevent damage to the mechanical system.		
<b>p1134[0...n]</b>	<b>Ramp-function generator rounding-off type / RFG round-off type</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 2 <b>Func. diagram:</b> 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the smoothed response to the OFF1 command or the reduced setpoint for the extended ramp-function generator.		
<b>Value:</b>	0: Cont. smoothing 1: Disc. smoothing		
<b>Dependency:</b>	No effect up to initial rounding-off time (p1130) > 0 s.		
<b>Note:</b>	p1134 = 0 (continuous smoothing) If the setpoint is reduced while ramping-up, initially a final rounding-off is carried out and then the ramp-up completed. During the final rounding-off, the output of the ramp-function generator continues to go in the direction of the previous setpoint (overshoot). After the final rounding-off has been completed, the output goes toward the new setpoint. p1134 = 1 (discontinuous smoothing) If the setpoint is reduced while ramping-up, then the output goes immediately in the direction of the new setpoint. For the setpoint change there is no rounding-off.

-

1

**Description:**

Sets the signal source for the command "continue ramp-function generator/freeze ramp-function generator".

For the PROFIdrive profile, this command corresponds to control word 1 bit 5 (STW1.5).

BI: p1141 = 0 signal:

Freezes the ramp-function generator.

BI: p1141 = 1 signal:

Continue ramp-function generator.

**Dependency:**

Refer to: p1140, p1142

**Caution:**

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

The ramp-function generator is, independent of the state of the signal source, active in the following cases:

- OFF1/OFF3.

- ramp-function generator output within the suppression bandwidth.

- ramp-function generator output below the minimum speed.

1

**Description:**

Sets the signal source for the command "enable setpoint/inhibit setpoint".

For the PROFIdrive profile, this command corresponds to control word 1 bit 6 (STW1.6).

BI: p1142 = 0 signal

Inhibits the setpoint (the ramp-function generator input is set to zero).

BI: p1142 = 1 signal

Setpoint enable.

**Dependency:**

Refer to: p1140, p1141

**Caution:**

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**

When the function module "position control" (r0108.3 = 1) is activated, this binector input is interconnected as follows as standard:

BI: p1142 = 0 signal

<b>p1143[0...n]</b>	<b>BI: Ramp-function generator, accept setting value / RFG accept set v</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / Binary <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 3060, 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for accepting the setting value of the ramp-function generator.		
<b>Dependency:</b>	The signal source for the ramp-function generator setting value is set using parameters. Refer to: p1144		
<b>Note:</b>	0/1 signal: The ramp-function generator output is immediately (without delay) set to the setting value of the ramp-function generator. 1 signal: The setting value of the ramp-function generator is effective. 1/0 signal: The input value of the ramp-function generator is effective. The ramp-function generator output is adapted to the input value using the ramp-up time or the ramp-down time. 0 signal: The input value of the ramp-function generator is effective.		
<b>p1144[0...n]</b>	<b>CI: Ramp-function generator setting value / RFG setting value</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 / FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> p2000 <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 3060, 3070 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the ramp-function generator setting value.		
<b>Dependency:</b>	The signal source for accepting the setting value is set using parameters. Refer to: p1143		
<b>p1145[0...n]</b>	<b>Ramp-function generator tracking intensity. / RFG track intens</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Setpoints <b>Not for motor type:</b> - <b>Min</b> 0.0	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 50.0	<b>Access level:</b> 3 <b>Func. diagram:</b> 3080 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.3
<b>Description:</b>	Sets the ramp-function generator tracking. The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration. The reference value is the deviation at the speed/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.		
<b>Recommend.:</b>	p1145 = 0.0: This value de-activates the ramp-function generator tracking. p1145 = 0.0 ... 1.0: Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating. p1145 > 1.0: The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value.		

**Notice:** If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration.

Remedy:

- switch off ramp-function generator tracking (p1145 = 0).
- increase the ramp-up/ramp-down time (p1120, p1121).

**Note:** In the U/f mode, ramp-function generator tracking is not active.

For SERVO with U/f operation, the following applies:

The complete ramp-function generator is not active, i.e. ramp-up and ramp-down time = 0.

---

**p1148[0...n] Ramp-function gen., tolerance for ramp-up and ramp-down active / RFG tol HL/RL act**

**p1200[0...n] Flying restart operating mode / FlyRest op\_mode**

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 1690
	<b>P-Group:</b> Functions	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	6	0

**Description:** Sets the operating mode for flying restart.

The flying restart allows the drive converter to be powered up while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.

<b>Value:</b>	0:	Flying restart inactive
	1:	Flying restart always active (start in setpoint direction)
	2:	FlyRestart active after on, fault, OFF2 (start in setp. dir.)
	3:	FlyRestart active after fault, OFF2 (start in setp. direction)
	4:	Flying restart always active (start only in setpoint direction)
	5:	FlyRestart active after on, fault, OFF2 (start only in setp_dir)
	6:	FlyRestart active after fault, OFF2 (start only in setp. dir.)

**Dependency:** For induction motors, the following applies:

A differentiation is made between flying restart for U/f control and for vector control (p1300).

Flying restart, U/f control: p1202, p1203, r1204

Flying restart, vector control: p1202, p1203, r1205

For synchronous motors, the following applies:

Flying restart is not possible with U/f control or if, in the case of sensorless vector control, a Voltage Sensing Module (VSM) has not been connected and parameterized.

If two VSMs are connected to the Motor Module, then the motor voltage for the flying restart is measured using the second VSM (see p0151[1]).

If only one VSM is connected, then this can be used for the flying restart.

Refer to: p1201

Refer to: F07330, F07331

**Notice:** The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent. It does not make sense to use "flying restart" together with the "motor holding brake function" (p1215 > 0) because then the flying restart will always be realized with the motor stationary.

**Note:** For p1200 = 1, 4, the following applies:  
Flying restart is active after faults, OFF1, OFF2, OFF3.  
For p1200 = 2, 5, the following applies:  
The "power-on" is the first power-on operation after the drive system has been booted. This is practical for motors with a high-inertia load.  
For p1200 = 1, 2, 3, the following applies: The search is made in both directions.  
For p1200 = 4, 5, 6, the following applies: The search is only made in the setpoint direction. For a setpoint of zero, a search is not made in the negative direction of rotation.  
For operation with encoder, the following applies:  
p1200 = 1, 4 as well as p1200 = 2, 5 and p1200 = 3, 6 have the same meaning.  
For U/f control (p1300 < 20), the following applies:  
The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.  
If p1200 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

**Description:** Sets the search current for the "flying restart" function.  
The value is referred to the motor magnetizing current.

**Dependency:** Refer to: r0331

**Caution:** An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

**Note:** In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the prevailing search current is set dependent upon the frequency on the basis of voltage inputs.

	-	-	0

**Description:** Modifies the pre-charging monitoring of the infeed.  
The active automatic restart (AR) of the following drive object can be interconnected using this binector input (BI: p1207 = r1214.2).  
This means that when the automatic restart is operational, the pre-charging monitoring of the infeed is de-activated and is only re-activated under the following conditions:  
- the absolute current in the DC link is greater than 2 % of the maximum current (r0209) of the infeed to provide protection against short-circuit in the DC link.  
- if a Voltage Sensing Module (VSM) is being used, the line supply voltage amplitude is greater than 3 % of the parameterized unit supply voltage (p0210) to protect the pre-charging resistors against continuous filter current when the line supply partially returns.

**Dependency:** Refer to: r0209, p0210, r1214

<b>p1208[0...1]</b>	<b>BI: AR modification infeed / AR modification</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 / Binary <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source to modify the automatic restart (AR). Interconnections between the automatic restart and infeed: With the following interconnection in the mode p1210 = 6, the automatic restart can respond to infeed faults: BI: p1208[0] = r2139.3 With the following interconnection, in the mode p1210 = 4, the automatic restart can respond to line supply failure of the infeed: BI: p1208[1] = r0863.2		
<b>Index:</b>	[0] = Infeed fault [1] = Infeed line supply failure		
<b>Dependency:</b>	Refer to: r0863, r2139		
<b>p1210</b>	<b>Automatic restart, mode / AR mode</b>		
B_INF	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 6	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the automatic restart mode (AR).		
<b>Value:</b>	0: Inhibit automatic restart 1: Acknowledge all faults without restarting 4: Restart after line supply failure w/o additional start attempts 6: Restart after fault with additional start attempts		
<b>Dependency:</b>	The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted. When using an Advanced Operator Panel (AOP) in the LOCAL Mode, then there is no automatic restart. Refer to: p0840, p0857, p1267 Refer to: F30003		
<b>Danger:</b>	If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic power-up sequence can only be interrupted by withdrawing the ON command.		
			
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). For p1210 > 1, the infeed is automatically started.		
<b>Note:</b>	When automatic restart mode is activated, the supply voltage must remain connected (e.g. backed up by UPS). Re p1210 = 1: Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. A minimum time of p1212 + 1 s must expire between a successful fault acknowledgement and a fault re-occurring if the signal ON/OFF1 (STW1.0) is at a HIGH signal level. If the signal ON/OFF1 is at a LOW signal level, then the time between a successful fault acknowledgement and a new fault must be at least 1 s. p1211 has no influence on the number of acknowledgment attempts. Re p1210 = 4: An automatic restart is only executed if fault F06200 has occurred. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.		

Re p1210 = 6:

An automatic restart is carried out if any fault has occurred.

<b>p1210</b>		<b>Automatic restart, mode / AR mode</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0 <b>Max</b> 16	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 16	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0	
<b>Description:</b>	Sets the automatic restart mode (AR).			
<b>Value:</b>	0: Inhibit automatic restart 1: Acknowledge all faults without restarting 4: Restart after line supply failure w/o additional start attempts 6: Restart after fault with additional start attempts 14: Restart after line supply failure following man. acknowledgment 16: Restart after fault following manual acknowledgment			
<b>Recommend.:</b>	For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.			
<b>Dependency:</b>	The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted. When using an Operator Panel in the LOCAL mode, then there is no automatic start. For p1210 = 14, 16, a manual acknowledgement is required for an automatic restart. Refer to: p0840, p0857, p1267 Refer to: F30003			
<b>Danger:</b> 	If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic power-up sequence can only be interrupted by withdrawing the ON command.			
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). When faults are present, therefore, the parameter cannot be changed. For p1210 > 1, the motor is automatically started.			
<b>Note:</b>	When automatic restart mode is activated, the supply voltage must remain connected (e.g. backed up by UPS). Re p1210 = 1: Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts. Re p1210 = 4: An automatic restart is only carried out if fault F30003 occurred at the Motor Module or a 1 signal is present at binector input p1208[1]. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure. Re p1210 = 6: An automatic restart is carried out if any fault has occurred or there is a 1 signal at binector input p1208[0]. Re p1210 = 14: As for p1210 = 4. However, faults that are present must be manually acknowledged. Re p1210 = 16: As for p1210 = 6. However, faults that are present must be manually acknowledged.			

<b>p1211</b>	<b>Automatic restart, start attempts / AR start attempts</b>		
B_INF	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 3
<b>Description:</b>	Sets the start attempts of the automatic restart function for p1210 = 4, 6.		
<b>Dependency:</b>	The setting of this parameter is always effective for p1210 = 6. For p1210 = 4, the parameter only has an influence if an additional line phase failure (F6200) occurs at the start attempt. Refer to: p1210, r1214 Refer to: F07320		
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).		
<b>Notice:</b>	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.		
<b>Note:</b>	A start attempt starts immediately when a fault occurs. The restart attempt is considered to have been completed if the infeed is powered up and an additional delay time of 1 s has expired. As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning. Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt (i.e. a fault/error has no longer occurred up to the end of the power-up operation) the start counter is again reset to the parameter value after 1 s. If faults re-occur, the parameterized number of start attempts is again available. At least one start attempt is always carried out. After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented.		

<b>p1211</b>	<b>Automatic restart, start attempts / AR start attempts</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 3
<b>Description:</b>	Sets the start attempts of the automatic restart function for p1210 = 4, 6.		
<b>Dependency:</b>	Refer to: p1210, r1214 Refer to: F07320		
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).		
<b>Notice:</b>	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.		

**Note:** A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized ( $r0056.4 = 1$ ) and an additional delay time of 1 s has expired.

As long as a fault is present, an acknowledge command is generated in the time intervals of  $p1212 / 2$ . When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning.

Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available.

At least one start attempt is always carried out.

After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented.

<b>p1212 Automatic restart, delay time start attempts / AR t_wait start</b>			
<b>B_INF</b>	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.1 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000.0 [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.0 [s]
<b>Description:</b>	Sets the delay time up to restart.		
<b>Dependency:</b>	This parameter setting is active for $p1210 = 4, 6$ . For $p1210 = 1$ , the following applies: Only automatic acknowledgment of the faults, no restart. Refer to: $p1210, r1214$		
<b>Caution:</b>	A change is only accepted and made in the state "initialization" ( $r1214.0$ ) and "wait for alarm" ( $r1214.1$ ).		
<b>Note:</b>	The faults are automatically acknowledged and the system is powered up again after half of the delay time has expired and after the full delay time has expired.		

---

<b>p1212 Automatic restart, delay time start attempts / AR t_wait start</b>			
<b>VECTOR_G</b>	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.1 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000.0 [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.0 [s]
<b>Description:</b>	Sets the delay time up to restart.		
<b>Dependency:</b>	This parameter setting is active for $p1210 = 4, 6$ . For $p1210 = 1$ , the following applies: Faults are only automatically acknowledged in half of the waiting time, no restart. Refer to: $p1210, r1214$		
<b>Caution:</b>	A change is only accepted and made in the state "initialization" ( $r1214.0$ ) and "wait for alarm" ( $r1214.1$ ).		
<b>Note:</b>	The faults are automatically acknowledged after half of the delay time has expired and the full delay time. If the cause of a fault is not removed in the first half of the delay time, then it is no longer possible to acknowledge in the delay time.		

p1213[0...1]			
B_INF	Automatic restart, monitoring time / AR t_monit		
	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: -	Func. diagram: -
	P-Group: Functions	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [s]	10000.0 [s]	0.0 [s]
Description:	Sets the monitoring time of the automatic restart (AR).		
Index:	[0] = Restart [1] = Reset start counter		
Dependency:	Refer to: p1210, r1214		
Caution:	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).		
Notice:	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.		
Note:	Index 0: The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If the drive has not restarted at the end of the monitoring time, fault F07320 is signaled. The monitoring is de-activated with p1213 = 0. If p1213 is set to a value which is lower than in p1212, fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). Index 1: The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.		

p1213[0...1]			
VECTOR_G	Automatic restart, monitoring time / AR t_monit		
	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: -	Func. diagram: -
	P-Group: Functions	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [s]	10000.0 [s]	0.0 [s]
Description:	Sets the monitoring time of the automatic restart (AR).		
Index:	[0] = Restart [1] = Reset start counter		
Dependency:	Refer to: p1210, r1214		
Caution:	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).		
Notice:	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.		
Note:	Index 0: The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is de-activated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.		

Index 1:

The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged.

The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

**Description:**

Displays the status of the automatic restart (AR).

**Bit field:**

<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
00	Initialization	Yes	No	-
01	Wait for alarm	Yes	No	-
02	Auto restart act	Yes	No	-
03	Setting the acknowledgement command	Yes	No	-
04	Acknowledge alarms	Yes	No	-
05	Restart	Yes	No	-
06	Delay time running after automatic power-up	Yes	No	-
07	Fault	Yes	No	-
10	Effective fault	Yes	No	-
12	Start count. bit 0	ON	OFF	-
13	Start count. bit 1	ON	OFF	-
14	Start count. bit 2	ON	OFF	-
15	Start count. bit 3	ON	OFF	-

**Note:**

Re bit 00:

State to display the single initialization after POWER ON.

Re bit 01:

State in which the automatic restart function waits for faults (initial state).

Re bit 02:

General display that a fault has been identified and that the restart or acknowledgement has been initiated.

Re bit 03:

Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

Re bit 04:

State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgement. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgement command (bit 3 = 1).

Re bit 05:

State in which the drive is automatically powered up (only for p1210 = 4, 6).

Re bit 06:

State in which the system waits after having been powered up, to the end of the start attempt.

For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

Re bit 07:

State which is assumed after a fault occurs within the automatic restart function.

Re bits 12 ... 15:

Actual state of the start counter (binary coded).

Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

Re bit 04:  
State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgement. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgement command (bit 3 = 1).

Re bit 05:  
State in which the drive is automatically powered up (only for p1210 = 4, 6).

Re bit 06:  
State in which the system waits after having been powered up, to the end of the start attempt (to the end of the magnetizing process).  
For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

Re bit 07:  
State which is assumed after a fault occurs within the automatic restart function. This is only reset after acknowledging the fault and withdrawing the power-on command.

Re bit 10:  
When the automatic restart function is active, r1214 bit 7 is displayed, otherwise the effective fault r2139 bit 3.

Re bits 12 ... 15:  
Actual state of the start counter (binary coded).

<b>p1215</b>	<b>Motor holding brake configuration / Brake config</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16  <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> -  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3	<b>Access level:</b> 2 <b>Func. diagram:</b> 2701, 2707, 2711 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the holding brake configuration.		
<b>Value:</b>	0: No motor holding brake available 1: Motor holding brake acc. to sequence control 2: Motor holding brake always open 3: Motor holding brake like sequence control, connection via BICO		
<b>Dependency:</b>	Refer to: p1216, p1217, p1226, p1227, p1228, p1278		
<b>Caution:</b>	For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.		
<b>Notice:</b>	If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.		
<b>Note:</b>	<p>If the configuration is set to "no holding brake present" when booting, then the motor holding brake will be automatically identified. If a motor holding brake is detected, the configuration is set to "motor holding brake as for sequence control".</p> <p>If a motor holding brake is used via the brake connection of the Motor Module integrated in the drive, then it is not permissible that p1215 is set to 3.</p> <p>if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.</p> <p>When the function module "extended brake control" is activated (r0108.14 = 1), r1229.1 should be interconnected as control signal.</p> <p>The parameter can only be set to zero when the pulses are inhibited.</p> <p>The parameterization "no motor holding brake available" and "Safe Brake Control" enabled (p1215 = 0, p9602 = 1, p9802 = 1) is not practical if there is no motor holding brake.</p> <p>The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.</p>		

---

<b>p1216</b>	<b>Motor holding brake, opening time / Brake t_open</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [ms]	<b>Access level:</b> 2 <b>Func. diagram:</b> 2701, 2711 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100 [ms]
<b>Description:</b>	Sets the time to open the motor holding brake. After controlling the holding brake (opens), the speed/velocity setpoint remains at zero for this time. After this, the speed/velocity setpoint is enabled.		
<b>Recommend.:</b>	This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied.		
<b>Dependency:</b>	Refer to: p1215, p1217		
<b>Note:</b>	For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.		

<b>p1217</b>	<b>Motor holding brake closing time / Brake t_close</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [ms]	<b>Access level:</b> 2 <b>Func. diagram:</b> 2701, 2711 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100 [ms]
<b>Description:</b>	Sets the time to apply the motor holding brake. After OFF1 or OFF3 and the holding brake is controlled (the brake closes), then the drive remains closed-loop controlled for this time stationary with a speed setpoint/velocity setpoint of zero. The pulses are suppressed when the time expires.		
<b>Recommend.:</b>	This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.		
<b>Dependency:</b>	Refer to: p1215, p1216		
<b>Notice:</b>	If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.		
<b>Note:</b>	For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

<b>Description:</b>	Sets the speed threshold for the standstill identification. Acts on the actual value and setpoint monitoring. When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified. The following applies when the brake control is activated: When the threshold is undershot, the brake control is started and the system waits for the brake closing time in p1217. The pulses are then suppressed. if the brake control is not activated, the following applies: When the threshold is undershot, the pulses are suppressed and the drive coasts down.		
<b>Dependency:</b>	Refer to: p1215, p1216, p1217, p1227		
<b>Notice:</b>	For reasons relating to the compatibility to earlier firmware versions, a parameter value of zero in indices 1 to 31 is overwritten with the parameter value in index 0 when the Control Unit boots.		
<b>Note:</b>	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.		

<b>p1227</b>	<b>Zero speed detection monitoring time / n_standst t_monit</b>				
VECTOR_G	<b>Can be changed:</b> U, T		<b>Calculated:</b> -		<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32		<b>Dynamic index:</b> -		<b>Func. diagram:</b> 2701, 2704
	<b>P-Group:</b> Functions		<b>Units group:</b> -		<b>Unit selection:</b> -
	<b>Not for motor type:</b> -		<b>Scaling:</b> -		<b>Expert list:</b> 1
	<b>Min</b>		<b>Max</b>		<b>Factory setting</b>
	0.000 [s]		300.000 [s]		4.000 [s]
<b>Description:</b>	Sets the monitoring time for the standstill identification. When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145). After this, the brake control is started, the system waits for the closing time in p1217 and then the pulses are suppressed.				
<b>Dependency:</b>	Refer to: p1215, p1216, p1217, p1226				
<b>Notice:</b>	For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.				
<b>Note:</b>	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. For p1227 = 300.000 s, the following applies: Monitoring is de-activated. For p1227 = 0.000 s, the following applies: With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down.				
<b>p1228</b>	<b>Pulse suppression delay time / Pulse suppr t_del</b>				
VECTOR_G	<b>Can be changed:</b> U, T		<b>Calculated:</b> -		<b>Access level:</b> 2

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	14	0
<b>Description:</b>	Setting to activate the various types for armature short-circuit / DC braking.		
<b>Value:</b>	0: No function 1: External armature short-circuit with contactor feedback signal 2: Ext. armature short circuit without contactor feedback signal 3: Internal voltage protection 4: Internal armature short-circuit / DC braking 5: DC braking for OFF1/OFF3 14: DC braking below starting speed		
<b>Dependency:</b>	Refer to: p0300, p1230, p1232, p1233, p1234, p1235, p1236, p1237, r1238, r1239, p1345, p1346		
<b>Danger:</b>	Re p1231 = 1, 2: - only short-circuit-proof motors may be used, or suitable resistors must be used to short-circuit the motor Re p1231 = 3: - when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)! - it is only permissible to use motors that are short-circuit proof (p0320 < p0323). - The Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209). - the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor. - if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components. - if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module. - if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).		

Re p1231 = 4 and synchronous motor:

- when armature short-circuit is active, all of the motor terminals are at half of the DC link potential.
- it is only permissible to use motors that are short-circuit proof ( $p0320 < p0323$ ).
- The Motor Module must be able to conduct 180% short-circuit current ( $r0320$ ) of the motor ( $r0209$ ).

**Note:**

Re p1231 = 1, 2:

The external armature short circuit can only be selected for synchronous motors ( $p0300$ ). In this case, control bit BO:  $r1239.0$  must be interconnected (e.g. to a digital input) to control the external contactor.

The external armature short circuit cannot be set as a fault response. It can be triggered via binector input  $p1230$ . It is also always activated in the case of pulse suppression.

Re p1231 = 3:

Internal voltage protection (using an internal armature short circuit) can only be selected for synchronous motors ( $p0300$ ) and Motor Modules in booksize or chassis format. Further, it is not permissible for Safety Integrated to be active on blocksize Motor Modules (i.e.  $p9501 = 0$  and  $p9601 = 0$ ). The internal voltage protection prevents the DC link capacitance from being charged if there is no possibility of regenerating the EMF of a motor operated in the field-weakening mode. The Motor Module must support this function ( $r0192.9 = 1$ ).

- a) If the Motor Module does not support the autonomous, internal armature short-circuit ( $r0192.10 = 0$ ), the armature short-circuit is activated as soon as the activation criterion is fulfilled (refer below):
- b) If the Motor Module supports the autonomous internal voltage protection ( $r0192.10 = 1$ ), then the Motor Module itself decides - using the DC link voltage - as to whether the short-circuit should be activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn. This therefore ensures that the required input voltage for the Control Supply Module is maintained.

For chassis units, the following applies:

The value for the voltage limits is calculated, depending on the voltage class, from EEPROM data of the particular power unit and a factor.

Re p1231 = 4:

The function is activated as soon as the activation criterion is fulfilled.

- the function can be superseded by OFF2

- a) For synchronous motors ( $p0300 = 2xx, 4xx$ ), the internal armature short-circuit is initiated.
- the Motor Module must support this function ( $r0192.9 = 1$ ).
- b) For induction motors ( $p0300 = 1xx$ ), the DC braking is initiated.

Activation criterion (one of the following criteria is fulfilled):

- binector input  $p1230 = 1$  signal (DC braking activation).
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing ( $r0046.19 = 0$ ).

Re p1231 = 5:

DC braking can only be set for induction motors.

DC braking is activated if the OFF1 or OFF3 command is present. Binector input  $p1230$  is ineffective. If the drive speed still lies above the speed threshold  $p1234$ , then initially, the drive is ramped-down to this threshold, demagnetized (see  $p0347$ ) and is then switched into DC braking for the time set in  $p1233$ . After this, the drive is switched off. If, at OFF1/OFF3, the drive speed is below  $p1234$ , then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely.

DC braking by means of fault response continues to be possible.

Re p1231 = 14:

DC braking can only be set for induction motors.

DC braking is initiated if binector input  $p1230 = 1$  during operation and the actual speed is below the starting speed  $p1234$  (before this, the drive must have operated above  $p1234$  plus the hysteresis). Then, following upstream demagnetization (see  $p0347$ ), the braking current  $p1232$  is injected for the time set in  $p1233$ . The drive then changes into normal operation. During braking the command for DC braking can be withdrawn. If the time  $p1233$  is exceeded, then DC braking is inhibited and the drive changes into normal operation.

For OFF1 and OFF3, DC braking is only executed, if binector input  $p1230 = 1$  signal.

DC braking by means of fault response continues to be possible.

Re p1231 = 3, 4, 5, 14:

The value can only be changed to values not equal to 3, 4, 5 or 14 if  $p0491$  is not equal to 4 and  $p2101$  is not equal to 6 (armature short-circuit/DC braking not set).

Note:  
 ASC: Armature Short Circuit  
 CSM: Control Supply Module  
 DCBRK: DC Braking  
 IVP: Internal Voltage Protection  
 UPS: Uninterruptible Power Supply

<b>p1232[0...n]</b>	<b>DC braking, braking current / DCBRK I_brake</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.00 [Arms]	<b>Access level:</b> 1 <b>Func. diagram:</b> 7017 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the braking current for DC braking.		
<b>Dependency:</b>	Refer to: p1230, p1231, p1233, p1234, r1239, p1345, p1346		
<b>Note:</b>	A change to the braking current becomes effective the next time that DC braking is switched on. The value for p1232 is specified as an rms value in the 3-phase system. The magnitude of the braking current is the same as that of an identical output current at frequency zero (see r0067, r0068, p0640). The braking current is internally limited to r0067. For the current controller, the settings of parameters p1345 and p1346 (I_max limiting controller) are used.		
<b>p1233[0...n]</b>	<b>DC braking time / DCBRK time</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0.0 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3600.0 [s]	<b>Access level:</b> 1 <b>Func. diagram:</b> 7017 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.0 [s]
<b>Description:</b>	Sets the DC braking time (as fault response).		
<b>Dependency:</b>	Refer to: p1230, p1231, p1232, p1234, r1239		
<b>Note:</b>	The time set is also effective when parameterizing DC braking as fault response. If a speed encoder is being used, DC braking is ended as soon as the drive falls below the standstill threshold (p1226).		
<b>p1234[0...n]</b>	<b>Speed at the start of DC braking / DCBRK n_start</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 1 <b>Func. diagram:</b> 7017 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 40000.00 [rpm]
<b>Description:</b>	Sets the starting speed for DC braking. If the actual speed falls below this threshold, then DC braking is activated.		
<b>Dependency:</b>	Refer to: p1230, p1231, p1232, p1233, r1239		
<b>Caution:</b>	If an encoder fault occurs during closed-loop operation with an encoder, controlled deceleration of the drive down to the start speed p1234 is no longer possible. In this case, DC braking is activated immediately and injects the braking current p1232 for the braking time p1233 after de-magnetizing. The braking current and braking duration must, therefore, be dimensioned accordingly for this situation so that the drive can be decelerated to standstill. In the case of operation with an encoder, this speed may not be set too low so as ensure that the oscillation movement induced by the residual flux/remanence of the motor does not cause DC braking to be de-activated again.		

<b>p1235[0...n]</b>	<b>BI: External armature short-circuit, contactor feedback signal / ASC ext feedback</b>

<b>Description:</b>	Sets the monitoring time of the contactor feedback signal for the external armature short-circuit configuration. If the contactor feedback signal (p1235) is parameterized, then the appropriate feedback signal (r1239.1) is expected within this monitoring time after either opening or closing the contactor.		
<b>Dependency:</b>	Refer to: p1230, p1231, p1235, p1237, r1239 Refer to: A07904, F07905		
<b>p1237[0...n]</b>	<b>External armature short-circuit, delay time when opening / ASC ext t_wait</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000 [ms]	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 200 [ms]
<b>Description:</b>	Sets the delay time when opening the contactor of the external armature short-circuit. If no contactor feedback signal has been selected (p1235), then the system waits for this time before the pulses are switched in.		
<b>Dependency:</b>	Refer to: p1230, p1231, p1235, p1236, r1239		
<b>Notice:</b>	This delay time must be at least long enough so that the contactor contacts reliably open before the pulses are switched in. The delay time must be greater than the contactor response time. The Motor Module can be damaged if the delay time is too short.		
<b>r1238</b>	<b>CO: Armature short-circuit, external state / EASC state</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> ASM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 6	<b>Access level:</b> 1 <b>Func. diagram:</b> 2610 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the state for the external armature short-circuit.		
<b>Value:</b>	0: Switched off 1: Ready 2: Active		

- 3: Active - feedback signal "Closed" OK
- 4: Active - feedback signal "Closed" missing
- 5: Prompt to remove the armature short-circuit
- 6: Active - feedback signal "Open" missing

**Dependency:** Refer to: p1230, p1231, p1235, p1236, p1237, r1239  
Refer to: A07904, F07905

**Note:** Activation criterion (one of the following criteria is fulfilled):

- the signal at BI: p1230 (armature short-circuit activation) is 0.
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Re state "switched out" (r1238 = 0):

- the external armature short-circuit can be selected with p1231 = 1.

Re state "ready" (r1238 = 1):

- as soon as the activation criterion is fulfilled, then a transition is made into the state "active" (r1238 = 2).

Regarding the state "active" (r1238 = 2), "active - feedback signal "Closed" OK" (r1238 = 3)", "active - feedback signal "Closed" missing" (r1238 = 4)":

- the control signal to close contactor r1239.0 is set to "1" (closed) and the pulses are suppressed.
- if a contactor feedback signal is not connected (BI: p1235 = 0 signal), then a transition is immediately made into state 3.
- if a contactor feedback signal is connected, then a transition is made into state 3 if the feedback signal at BI: p1235 goes to "1" (closed) within the monitoring time (p1236).
- otherwise, a transition is made into state 4.

Re state "prompt to remove the armature short-circuit" (r1238 = 5):

- the activation criterion is no longer fulfilled. An attempt is made to again remove the armature short circuit.
- the control signal to close the contactor r1239.0 is set to "0" (open) and the pulses remain suppressed.
- if a contactor feedback signal is not connected (BI: p1235 = 0 signal), the system waits for the delay time (p1237) to expire until a transition is made into state 1.
- if a contactor feedback signal is connected, the system waits until the feedback signal at BI: p1235 goes to "0" (open) until a transition is made into state 1. If this does not occur within the monitoring time (p1236), then a transition is made into state 6.

Re state "active - feedback signal "Open" missing" (r1238 = 6):

- this error state can be exited by de-selecting the external armature short-circuit (p1231 = 0).

---

<b>p1240[0...n]</b>	<b>Vdc controller or Vdc monitoring configuration / Vdc_ctrl config</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 6	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the controller configuration of the DC link voltage (Vdc controller) in the closed-loop control mode.		

<b>Value:</b>	0: Inhib Vdc ctrl 1: Vdc_max controller enable 2: Vdc_min controller (kinetic buffering) enable 3: Vdc_min controller and Vdc_max controller enable 4: Activates Vdc_max monitoring 5: Activates Vdc_min monitoring 6: Activates Vdc_min monitoring and Vdc_max monitoring
<b>Dependency:</b>	Refer to: p1245 Refer to: A07400, A07401, A07402, F07403, F07404, F07405, F07406
<b>Warning:</b>	When the Udc max controller is active, the motor can accelerate, e.g. for driving loads or for high DC link voltages caused by other drives that are connected to the common DC link busbar.
	
<b>Caution:</b>	If several drives are operated from the same DC link busbar, then it is recommended that the Udc control is only activated for the drives with high moments of inertia. If the Udc controls for various drives are simultaneously active, then they can mutually influence one another. In this case, the controller dynamic performance should be reduced or the Udc control of individual drives should be deactivated. Drives with Udc control must be able to brake and accelerate independently of one another.
	
<b>Notice:</b>	An excessively high value in p1245 can possibly negatively influence the normal operation of the drive.
<b>Note:</b>	p1240 = 1, 3: When the DC link voltage limit specified for the Motor Module is reached the following applies: - the Vdc_max controller limits the regenerative energy in order that the DC link voltage is kept below the maximum DC link voltage when braking. - the ramp-down times are automatically increased. p1240 = 2, 3: When the switch-in threshold of the Vdc_min controller is reached (p1245), the following applies: - the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating. - the motor is braked in order to use its kinetic energy to buffer the DC link. p1240 = 4, 5, 6: When the threshold in r1242 or r1246 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage. If a braking resistor is connected to the DC link, then the Vdc_max control should be disabled. See also p1531.

<b>r1242</b>	<b>Vdc_max controller switch-in level / Vdc_max on_level</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> - [V]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> p2001 <b>Max</b> - [V]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [V]
<b>Description:</b>	Displays the switch-in level for the Vdc_max controller. If p1254 = 0 (automatic sensing of the switch-in level = off), then the following applies: AC/AC device: $r1242 = 1.15 \cdot \sqrt{2} \cdot p0210$ DC/AC device: $r1242 = 1.15 \cdot p0210$ If p1254 = 1 (automatic sensing of the switch-in level = on), then the following applies: $r1242 = Vdc\_max - 50.0 \text{ V}$ (Vdc_max: Overvoltage threshold of the power unit) $r1242 = Vdc\_max - 25.0 \text{ V}$ (for 230 V power units)		
<b>Note:</b>	The Vdc_max controller is not switched back off until the DC-link voltage falls below the threshold $0.95 \cdot p1242$ and the controller output is zero.		

<b>p1243[0...n]</b>	<b>Vdc_max controller dynamic factor / Vdc_max dyn_factor</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 1 [%]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100 [%]
<b>Description:</b>	Sets the dynamic factor for the DC link voltage controller (Vdc_max controller). 100% means that p1250, p1251, and p1252 (gain, integral time, and rate time) are used corresponding to their basic settings and based on a theoretical controller optimization. If subsequent optimization is required, this can be carried out using the dynamic factor. In this case p1250, p1251, p1252 are weighted with the dynamic factor p1243. If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.		
<b>Note:</b>	The pre-setting of the dynamic factor is based on the power units connected to DRIVE-CLiQ. It is assumed that the power units connected via DRIVE-CLiQ are also electrically connected to the DC link. If this is not the case, then the dynamic factor must be optimized manually.		
<b>p1245[0...n]</b>	<b>Vdc_min controller switch-in level (kinetic buffering) / Vdc_min on_level</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 65 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 150 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 76 [%]
<b>Description:</b>	Sets the switch-in level for the Vdc-min controller (kinetic buffering). The value is obtained as follows: AC/AC device: $r1246[V] = p1245[\%] * \sqrt{2} * p0210$ DC/AC device: $r1246[V] = p1245[\%] * p0210$		
<b>Dependency:</b>	Refer to: p0210		
<b>Warning:</b>	An excessively high value may adversely affect normal drive operation. The values up to 150 % are intended for operating modes p1240 = 5, 6.		
			
<b>Note:</b>	For SINAMICS GM/SM, the following applies: Minimum value = 0.75, Maximum value = 0.90		
<b>r1246</b>	<b>Vdc_min controller switch-in level (kinetic buffering) / Vdc_min on_level</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> - [V]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> p2001 <b>Max</b> - [V]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [V]
<b>Description:</b>	Displays the switch-in level for the Vdc_min controller (kinetic buffering).		
<b>Note:</b>	The Vdc_min controller is not switched back off until the DC-link voltage rises above the threshold $1.05 * p1246$ and the controller output is zero.		

<b>p1247[0...n]</b>	<b>Vdc_min controller dynamic factor (kinetic buffering) / Vdc_min dyn_factor</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 1 [%]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100 [%]
<b>Description:</b>	Sets the dynamic factor for the Vdc_min controller (kinetic buffering). 100% means that p1250, p1251, and p1252 (gain, integral time, and rate time) are used corresponding to their basic settings and based on a theoretical controller optimization. If subsequent optimization is required, this can be carried out using the dynamic factor. In this case p1250, p1251, p1252 are weighted with the dynamic factor p1247. If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.		
<b>p1249[0...n]</b>	<b>Vdc_max controller speed threshold / Vdc_max n_thresh</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 3_1 <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 10.00 [rpm]
<b>Description:</b>	Sets the lower speed threshold for the Vdc_max controller. When this speed threshold is undershot, the Vdc_max control is switched out and the speed is controlled using the ramp-function generator.		
<b>Note:</b>	For fast braking where the ramp-function generator tracking was active, it is possible to prevent the drive rotating in the opposite direction by increasing the speed threshold and setting a final rounding-off time in the ramp-function generator (p1131). This is supported using a dynamic setting of the speed controller.		
<b>p1250[0...n]</b>	<b>Vdc controller proportional gain / Vdc_ctrl Kp</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 0.00	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100.00	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.00
<b>Description:</b>	Sets the proportional gain for the DC-link voltage controller (Vdc_min controller, Vdc_max controller).		
<b>Dependency:</b>	The effective proportional gain is obtained taking into account p1243 (Vdc_max controller dynamic factor).		
<b>Note:</b>	The gain factor is proportional to the capacitance of the DC link. The parameter is pre-set to a value that is optimally adapted to the capacitance of the individual Motor Module. The capacitances of the other power units, which are connected to the DC link, can be taken into account using the dynamic factor (p1247 or p1243).		
<b>p1251[0...n]</b>	<b>Vdc controller integral time / Vdc_ctrl Tn</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0 [ms]
<b>Description:</b>	Sets the integral time for the DC-link voltage controller (Vdc_min controller, Vdc_max controller).		
<b>Dependency:</b>	The effective integral time is obtained taking into account p1243 (Vdc_max controller dynamic factor).		

**Note:** An integral time is normally not required for single axis drives. For multi-axis drives on the other hand, it may be possible to compensate for interference from other axes using the integral time (integral component) .  
p1251 = 0: The integral component is de-activated.

<b>p1252[0...n]</b>	<b>Vdc controller rate time / Vdc_ctrl t_rate</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> REL <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6220 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0 [ms]
<b>Description:</b>	Sets the rate time constant for the DC-link voltage controller (Vdc_min controller, Vdc_max controller).		
<b>Dependency:</b>	The effective rate time is obtained taking into account p1243 (Vdc_max controller dynamic factor).		
<b>p1254</b>	<b>Vdc_max controller automatic ON level detection / Vdc_max SenseOnLev</b>

	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -		
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1		
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>		
	0	3	0		
<b>Description:</b>	Sets the configuration for the bypass function.				
<b>Value:</b>	0: Bypass de-activated 1: Bypass with synchronization and overlap 2: Bypass with synchronization without overlap 3: Bypass without synchronization				
<b>Note:</b>	If the bypass function is selected ((p1260 > 0), then when the power unit restarts after POWER OFF, the state of the bypass switch is evaluated. This means that after the ramp-up, it is possible to directly change into the standby mode. This is only possible for p1267 = 1 (bypass using the control signal) and if the control command after the system has been booted is still available (p1266). This function has a higher priority than the automatic restart function (p1210).  The "bypass" function can only be switched off again (p1260 = 0) if the bypass is not active or the bypass function has a fault.  The corresponding function should be activated in p3800 for bypass with synchronization.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1		
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>		
	-	-	0		
<b>Description:</b>	Sets the signal source for the feedback signal of the bypass switch.				
<b>Index:</b>	[0] = Switch motor/drive [1] = Switch motor/line supply				
<b>Note:</b>	In the case of switches without a feedback signal, interconnect the corresponding control bit as the signal source: BI: p1269[0] = r1261.0 BI: p1269[1] = r1261.1				

<b>p1272</b>	<b>Simulation mode / Simulation mode</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	<p>In the simulation mode, the closed-loop control or U/f control can be operated without motor.</p> <p>The simulation mode is used to test the power unit. Even though the DC link voltage is missing, the pulses are enabled when powering up. The DC link pre-charging is bypassed and the undervoltage detection is disabled.</p> <p>Closed-loop speed control with an encoder is possible if the torque setpoint (r0079) is used in order to operate a second drive in the closed-loop torque controlled mode.</p>		
<b>Value:</b>	0: OFF 1: ON		
<b>Dependency:</b>	<p>The following functions are de-activated in the simulation mode:</p> <ul style="list-style-type: none"> <li>- motor data identification routine</li> <li>- motor data identification routine, rotating without encoder</li> <li>- pole position identification</li> </ul> <p>For U/f control and sensorless vector control, flying restart is not carried out (refer to p1200).</p> <p>Refer to: r0192, p1900, p1910, p1960, p1990</p> <p>Refer to: A07825, F07826</p>		
<b>Notice:</b>	<p>In simulation mode, binector output r0863.1 = 1 is set. This is why you need to check whether other devices are powered up via this signal before activating simulation mode. You might need to disconnect the corresponding BICO interconnection temporarily.</p>		
<b>Note:</b>	<p>Simulation mode is only possible for DC link voltages below 40 V. In order that the closed-loop control can be calculated, the displayed DC link voltage (r0026, r0070) is set to the rated DC link voltage (refer to p0210). Closed-loop current control and motor model are switched out (disabled) - the same is true for the speed controller for encoder-less closed-loop speed control.</p> <p>When fault messages occur, the parameter is not automatically reset. This function is not implemented for SINAMICS GM.</p>		
<b>p1274[0...1]</b>	<b>Bypass switch monitoring time / Switch t_monit</b>

### p1276 Motor holding brake, standstill detection, bypass / Brk standst bypass

VECTOR_G (Extended brk)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2704
	<b>P-Group:</b> Functions	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.000 [s]	300.000 [s]	300.000 [s]

**Description:** Sets the delay time for closing the brake at standstill.  
After this time has expired, if the "close brake at standstill" or OFF1/OFF3 is present, the brake is closed and the pulses are suppressed.  
For p1276 = 300.000 s, the timer is de-activated - this means that the timer output is always zero.

### p1277 Motor holding brake, braking threshold delay exceeded / Del thresh exceed.

VECTOR_G (Extended brk)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2707
	<b>P-Group:</b> Functions	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.000 [s]	300.000 [s]	0.000 [s]

**Description:** Sets the delay time for the signal "braking threshold exceeded" (BO: r1229.6).

**Dependency:** Refer to: p1220, p1221, r1229

### p1278 Brake control, diagnostics evaluation / Brake diagnostics

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Functions	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0

**Description:** Sets the brake control type (with or without diagnostics evaluation).

Example for brake control with diagnostics evaluation.

- brake control in the Motor Modules in booksize format

- Safe Brake Relay for AC Drive

Example for brake control without diagnostics evaluation.

- Brake Relay for AC Drive

**Value:**  
0: Brake control with diagnostics evaluation  
1: Brake control without diagnostics evaluation

**Note:** If the configuration of the motor holding brake (p1215) is set to "no holding brake present" when booting, then an automatic identification of the motor holding brake will be carried out. If a brake control is detected without diagnostics evaluation (e.g. Brake Relay for AC Drive), then the parameter is set to "brake control without diagnostics evaluation".

It is not permissible to parameterize "brake control without diagnostics evaluation" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

<b>p1279[0...3]</b>	<b>BI: Motor holding brake, OR/AND logic operation / Brake OR AND</b>		
VECTOR_G (Extended brk)	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / Binary <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> 2707 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the OR/AND logic operation.		
<b>Dependency:</b>	Refer to: r1229		
<b>Note:</b>	[0]: OR logic operation, input 1 --> the result is displayed in r1229.10. [1]: OR logic operation, input 2 --> the result is displayed in r1229.10. [2]: AND logic operation, input 1 --> the result is displayed in r1229.11. [3]: AND logic operation, input 2 --> the result is displayed in r1229.11.		
<b>p1280[0...n]</b>	<b>Vdc controller or Vdc monitoring configuration (U/f) / Vdc_ctr config U/f</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 6	<b>Access level:</b> 3 <b>Func. diagram:</b> 1690, 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.		
<b>Value:</b>	0: Inhib Vdc ctrl 1: Vdc_max controller enable 2: Vdc_min controller (kinetic buffering) enable 3: Vdc_min controller and Vdc_max controller enable 4: Activates Vdc_max monitoring 5: Activates Vdc_min monitoring 6: Activates Vdc_min monitoring and Vdc_max monitoring		
<b>Warning:</b>	When the Udc max controller is active, the motor can accelerate, e.g. for driving loads or for high DC link voltages caused by other drives that are connected to the common DC link busbar.		
			
<b>Caution:</b>	If several drives are operated from the same DC link busbar, then it is recommended that the Udc control is only activated for the drives with relatively high moments of inertia. If the Udc controls for various drives are simultaneously active, then they can mutually influence one another. In this case, the controller dynamic performance should be reduced or the Udc control of individual drives should be deactivated. Drives with Udc control must be able to brake and accelerate independently of one another.		
			
<b>Note:</b>	p1240 = 4, 5, 6: When the threshold in r1282 or r1286 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage. If a braking resistor is connected to the DC link, then the Vdc_max control should be disabled.		
<b>r1282</b>	<b>Vdc_max controller switch-in level (U/f) / Vdc_max on_level</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> - [V]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> p2001 <b>Max</b> - [V]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [V]
<b>Description:</b>	Displays the switch-in level for the Vdc_max controller. If p1294 = 0 (automatic sensing of the switch-in level = off), then the following applies: AC/AC device: $r1282 = 1.15 * \sqrt{2} * p0210$ DC/AC device: $r1282 = 1.15 * p0210$		

If p1294 = 1 (automatic sensing of the switch-in level = on), then the following applies:

r1282 = Vdc\_max - 50.0 V (Vdc\_max: Overvoltage threshold of the power unit)

r1282 = Vdc\_max - 25.0 V (for 230 V power units)

**Note:**

The Vdc\_max controller is not switched back off until the DC-link voltage falls below the threshold  $0.95 \cdot p1282$  and the controller output is zero.

p1283[0...n]	Vdc_max controller dynamic factor (U/f) / Vdc_max dyn_factor		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 1 [%]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100 [%]
<b>Description:</b>	Sets the dynamic factor for the DC link voltage controller (Vdc_max controller). 100% means that p1290, p1291, and p1292 (gain, integral time, and rate time) are used in accordance with their basic settings and on the basis of a theoretical controller optimization. If subsequent optimization is required, this can be carried out using the dynamic factor. In this case, p1290, p1291, and p1292 are weighted with the dynamic factor p1283. If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.		
<b>Note:</b>	The pre-setting of the dynamic factor is based on the power units connected to DRIVE-CLiQ. It is assumed that the power units connected via DRIVE-CLiQ are also electrically connected to the DC link. If this is not the case, then the dynamic factor must be optimized manually.		

p1285[0...n]	Vdc_min controller switch-in level (kinetic buffering) (U/f) / Vdc_min on_level		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 65 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 150 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 76 [%]
<b>Description:</b>	Sets the switch-in level for the Vdc-min controller (kinetic buffering). The value is obtained as follows: AC/AC unit: $p1286[V] = p1285[\%] \cdot \sqrt{2} \cdot p0210$ DC/AC unit: $p1286[V] = p1285[\%] \cdot p0210$		
<b>Warning:</b>	An excessively high value may adversely affect normal drive operation. The values up to 150 % are intended for operating modes p1240 = 5, 6.		
			

r1286	Vdc_min controller switch-in level (kinetic buffering) (U/f) / Vdc_min on_level		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> - [V]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> p2001 <b>Max</b> - [V]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [V]
<b>Description:</b>	Displays the switch-in level for the Vdc_min controller (kinetic buffering).		
<b>Note:</b>	The Vdc_min controller is not switched back off until the DC-link voltage rises above the threshold $1.05 \cdot p1286$ and the controller output is zero.		

<b>p1287[0...n]</b>	<b>Vdc_min controller dynamic factor (kinetic buffering) (U/f) / Vdc_min dyn_factor</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 1 [%]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100 [%]
<b>Description:</b>	Sets the dynamic factor for the Vdc_min controller (kinetic buffering). 100% means that p1290, p1291, and p1292 (gain, integral time, and rate time) are used corresponding to their basic settings and based on a theoretical controller optimization. If subsequent optimization is required, this can be carried out using the dynamic factor. In this case, p1290, p1291, and p1292 are weighted with the dynamic factor p1287. If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.		
<b>Note:</b>	The pre-setting of the dynamic factor is based on the power units connected to DRIVE-CLiQ. It is assumed that the power units connected via DRIVE-CLiQ are also electrically connected to the DC link. If this is not the case, then the dynamic factor must be optimized manually.		
<b>p1288[0...n]</b>	<b>Vdc_max controller feedback coupling factor ramp-fct. gen. (U/f) / Vdc_max factor RFG</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.000	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100.000	<b>Access level:</b> 4 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.500
<b>Description:</b>	Sets the feedback factor for the ramp-function generator. Its ramp times are decelerated relative to the output signal of the Vdc_max controller.		
<b>Note:</b>	For values p1288 = 0.0 to 0.5, the controller dynamics are automatically adapted internally.		
<b>p1289[0...n]</b>	<b>Vdc_max controller speed threshold (U/f) / Vdc_max n_thresh</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 3_1 <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 10.00 [rpm]
<b>Description:</b>	Sets the lower speed threshold for the Vdc_max controller. When this speed threshold is undershot, the Vdc_max control is switched out and the speed is controlled using the ramp-function generator.		
<b>p1290[0...n]</b>	<b>Vdc controller proportional gain (U/f) / Vdc_ctrl Kp</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.00	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100.00	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.00
<b>Description:</b>	Sets the proportional gain for the Vdc controller (DC link voltage controller).		
<b>Note:</b>	The gain factor is proportional to the capacitance of the DC link. The parameter is pre-set to a value that is optimally adapted to the capacitance of the individual Motor Module. The capacitances of the other power units which are connected to the DC link can be taken into account using the dynamic factor (p1287 or p1283).		

<b>p1291[0...n]</b>	<b>Vdc controller integral time (U/f) / Vdc_ctrl Tn</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 40 [ms]
<b>Description:</b>	Sets the integral time for the Vdc controller (DC link voltage controller).		
<b>p1292[0...n]</b>	<b>Vdc controller rate time (U/f) / Vdc_ctrl t_rate</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 10 [ms]
<b>Description:</b>	Sets the rate time constant for the Vdc controller (DC link voltage controller).		
<b>p1293[0...n]</b>	<b>Vdc min controller output limit (U/f) / Vdc_min outp_lim</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.00 [Hz]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 600.00 [Hz]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 10.00 [Hz]
<b>Description:</b>	Sets the output limit for the Vdc min controller (DC link undervoltage controller).		
<b>p1294</b>	<b>Vdc_max controller automatic detection ON signal level (U/f) / Vdc_max SenseOnLev</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Activates/de-activates the automatic sensing of the switch-in level for the Vdc_max controller. When the sensing function is de-activated, the activation threshold r1282 for the Vdc_max controller is determined from the parameterized connection voltage p0210.		
<b>Value:</b>	0: Automatic detection inhibited 1: Automatic detection enabled		
<b>p1295[0...n]</b>	<b>Vdc_min controller time threshold (U/f) / Vdc_min t_thresh</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.000 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.000 [s]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000 [s]
<b>Description:</b>	Sets the time threshold for the Vdc_min controller (kinetic buffering). If this value is exceeded a fault is output; the required response can be parameterized. Prerequisite: p1296 = 1.		

**Notice:** If a time threshold has been parameterized, the Vdc\_max controller should also be activated (p1280 = 3) so that the drive does not shut down with overvoltage when Vdc\_min control is exited (due to the time violation) and in the event of fault response OFF3. It is also possible to increase the OFF3 ramp-down time p1135.

<b>p1296[0...n] Vdc_min controller response (kinetic buffering) (U/f / Vdc_min response)</b>			
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the response for the Vdc_min controller (kinetic buffering).		
<b>Value:</b>	0: Buffer Vdc until undervoltage, n<p1297 -> F07405 1: Buff. Vdc until undervolt., n<p1297 -> F07405, t>p1295 -> F07406		
<b>Note:</b>	Re p1296 = 1: The quick stop ramp entered in p1135 must not be equal to zero, to prevent overcurrent shutdown if F07406 is triggered.		

<b>p1297[0...n] Vdc_min controller speed threshold (U/f) / Vdc_min n_thresh</b>			
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 3_1 <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 50.00 [rpm]
<b>Description:</b>	Sets the speed threshold for the Vdc-min controller (kinetic buffering). If this value is exceeded a fault is output; the required response can be parameterized .		

<b>r1298 CO: Vdc controller output (U/f) / Vdc_ctrl output</b>			
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> - [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 3_1 <b>Scaling:</b> p2000 <b>Max</b> - [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6320 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [rpm]
<b>Description:</b>	Displays the actual output of the Vdc controller (DC link voltage controller)		

<b>p1300[0...n] Open-loop/closed-loop control operating mode / Op/cl-lp ctrl_mode</b>			
VECTOR_G	<b>Can be changed:</b> C2(1), T <b>Data type:</b> Integer16  <b>P-Group:</b> U/f open-loop control <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 19	<b>Access level:</b> 2 <b>Func. diagram:</b> 1690, 6300, 6310, 6320 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the U/f control mode of the drive.		
<b>Value:</b>	0: U/f control with linear characteristic 1: U/f control with linear characteristic and FCC 2: U/f control with parabolic characteristic 3: U/f control with parameterizable characteristic 4: U/f control with linear characteristic and ECO 5: U/f control for drives requiring a precise freq. (e.g. textiles) 6: U/f control for drives requiring a precise frequency and FCC 7: U/f control for a parabolic characteristic and ECO		

- 15: Operation with braking resistor  
 19: U/f control with independent voltage setpoint

**Recommend.:** The use of the vector control operating modes is recommended for synchronous motors.

**Dependency:** If you are working with reduced supply voltages (p0212.0 = 1), only U/f control with independent voltage setpoint (p1300 = 19) can be set as the operating mode.  
 p1300 = 15 (operation with braking resistor), can only be activated or deactivated in quick commissioning (p0010 = 1). This operating mode is only possible for chassis power units (DC/AC Motor Module).

**Notice:** Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%).  
 The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.

**Note:** For the open-loop control modes p1300 = 5 and 6, the slip compensation p1335 and the resonance damping p1338 are internally switched out (disabled) in order to be able to precisely set the output frequency.  
 For the open-loop control modes p1300 = 4 and 7 (Eco mode), the efficiency can be optimized by varying the voltage (when the operating point is constant).  
 During operation (pulses enabled) the open-loop control mode cannot be changed by changing over drive data sets.

p1300[0...n]		Open-loop/closed-loop control operating mode / Op/cl-lp ctrl_mode	
VECTOR_G (n/M)	<b>Can be changed:</b> C2(1), T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 1690, 1700, 6300, 8012
	<b>P-Group:</b> U/f open-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 23	<b>Factory setting</b> 20
<b>Description:</b>	Sets the open and closed-loop control mode of a drive.		
<b>Value:</b>	0: U/f control with linear characteristic 1: U/f control with linear characteristic and FCC 2: U/f control with parabolic characteristic 3: U/f control with parameterizable characteristic 4: U/f control with linear characteristic and ECO 5: U/f control for drives requiring a precise freq. (e.g. textiles) 6: U/f control for drives requiring a precise frequency and FCC 7: U/f control for a parabolic characteristic and ECO 15: Operation with braking resistor 18: I/f control with fixed current 19: U/f control with independent voltage setpoint 20: Speed control (encoderless) 21: Speed control (with encoder) 22: Torque control (encoderless) 23: Torque control (with encoder)		
<b>Recommend.:</b>	The use of the vector control operating modes is recommended for synchronous motors.		
<b>Dependency:</b>	Closed-loop speed or torque control (with encoder) cannot be selected if the encoder type is not entered (p0400). Closed-loop speed or torque control can be selected if the closed-loop speed/torque control was selected as operating mode (p0108.2). Only operation with U/f characteristic is possible if the rated motor speed is not entered (p0311). A reluctance motor can only be operated in a U/f control mode (p1300 < 20). Sensorless control on separately excited synchronous motors is only possible with a VSM module (see p0150, p0151). For chassis power units with reduced line voltage (see r0212 bit 0), the drive can only be operated in a control mode (p1300 = 20...23) and with the DC link voltage control activated. Refer to: p0108, r0108, p0212, p0300, p0311, p0400, p1501		
<b>Notice:</b>	Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%).		

The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.

**Note:** The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3.

For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I<sub>max</sub> frequency controller are switched off internally so that the output frequency can be set precisely. The I<sub>max</sub> voltage controller remains active.

For the open-loop control modes p1300 = 4 and 7 (Eco mode), the efficiency can be optimized by varying the voltage (when the operating point is constant).

Separately-excited synchronous motors can only be operated in modes p1300 = 20, 21 and 23 - or for diagnostic purposes in modes p1300 = 0, 3 and 18. For I/f control (p1300 = 18), the current amplitude can be set using p1609. Both for U/f as well as for I/f control only a small load may be applied to the separately-excited synchronous motor because the excitation current is not calculated as a function of the load.

During operation (pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

p1300 is pre-assigned depending on r0108.2 and p0187.

---

**p1302[0...n] U/f control configuration / U/f configuration**

<b>VECTOR_G</b>	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> -
	<b>P-Group:</b> U/f open-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 bin

**Description:** Sets the configuration for the U/f control.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	U_output starting angle zero	Yes	No	-
	01	Take into account the setpoint voltage sign	Yes	No	-

**Note:** Re bit 00:  
If the bit is set the device will always start up with setpoint angle zero on pulse enable. This also affects the setpoint angle for DC braking (p1231).

Re bit 01:  
If the bit is set, in the case of U/f control with independent voltage setpoint (p1300 = 19) and negative setpoint voltages at the input of p1330, the setpoint angle is rotated through 180 degrees, thereby achieving a negative output voltage. The voltage boost is in this case not active (p1310, p1311).

---

**p1310[0...n] Voltage boost permanent / U\_boost perm**

<b>VECTOR_G</b>	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 1690, 6300
	<b>P-Group:</b> U/f open-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.0 [%]	250.0 [%]	50.0 [%]

**Description:** Defines the voltage boost as a [%] referred to the rated motor current (p0305).

The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present.

The magnitude of the boost in Volt at a frequency of zero is defined as follows:

$$\text{Voltage boost [V]} = 1.732 \times p0305 (\text{rated motor current [A]}) \times r0395 (\text{stator/primary section resistance [ohm]}) \times p1310 (\text{permanent voltage boost [\%]}) / 100 \%$$

At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following:

- magnetize the induction motor.
- hold the load.
- compensate for losses in the system.

This is the reason that the output voltage can be increased using p1310.  
The voltage boost can be used for both linear as well as square-law U/f characteristics.  
**Dependency:** The current limit p0640 limits the boost.  
For vector control, the permanent voltage boost (p1310) has no effect as the drive converter automatically sets the optimum operating conditions.  
Refer to: p1300, p1311, p1312, r1315  
**Notice:** The voltage boost increases the motor temperature (particularly at zero speed).  
**Note:** The voltage boost is only effective for U/f control (p1300).  
The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)).  
However, these parameters are assigned the following priorities: p1310 > p1311, p1312

---

**p1311[0...n] Voltage boost at acceleration / U\_boost accelerate**

**VECTOR\_G** **Can be changed:** U, T **Calculated:** - **Access level:** 2  
**Data type:** FloatingPoint32 **Dynamic index:** DDS, p0180 **Func. diagram:** 1690, 6300  
**P-Group:** U/f open-loop control **Units group:** - **Unit selection:** -  
**Not for motor type:** - **Scaling:** - **Expert list:** 1  
**Min** **Max** **Factory setting**  
0.0 [%] 250.0 [%] 0.0 [%]

**Description:** p1311 only results in a voltage boost when accelerating and generates a supplementary torque to accelerate the load.  
The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed.  
The magnitude of the boost in Volt at a frequency of zero is defined as follows:  
Voltage boost [V] = 1.732 \* p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1311 (voltage boost when accelerating [%]) / 100 %

**Dependency:** The current limit p0640 limits the boost.  
Refer to: p1300, p1310, p1312, r1315

**Notice:** The voltage boost results in a higher motor temperature increase.

**Note:** The voltage boost when accelerating can improve the response to small, positive setpoint changes.  
Assigning priorities for the voltage boosts: refer to p1310

---

**p1312[0...n] Voltage boost when starting / U\_boost starting**

**VECTOR\_G** **Can be changed:** U, T **Calculated:** - **Access level:** 2  
**Data type:** FloatingPoint32 **Dynamic index:** DDS, p0180 **Func. diagram:** 1690, 6300  
**P-Group:** U/f open-loop control **Units group:** - **Unit selection:** -  
**Not for motor type:** - **Scaling:** - **Expert list:** 1  
**Min** **Max** **Factory setting**  
0.0 [%] 250.0 [%] 0.0 [%]

**Description:** Setting for an additional voltage boost when powering-up, however, only for the first acceleration phase.  
The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed.

**Dependency:** The current limit p0640 limits the boost.  
Refer to: p1300, p1310, p1311, r1315

**Notice:** The voltage boost results in a higher motor temperature increase.

**Note:** The voltage boost when accelerating can improve the response to small, positive setpoint changes.  
Assigning priorities for the voltage boosts: refer to p1310

<b>r1315</b>	<b>Voltage boost total / U_boost total</b>

<b>Description:</b>	Sets the starting frequency at which FCC (Flux Current Control) is activated.		
<b>Dependency:</b>	The correct operating mode must be set (p1300 = 1, 6).		
<b>Warning:</b>	An excessively low value can result in instability.		

**Note:** For p1333 = 0 Hz, the FCC starting frequency is automatically set to 6 % of the rated motor frequency.

<b>p1334[0...n]</b>	<b>U/f control slip compensation starting frequency / Slip comp start</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> U/f open-loop control <b>Not for motor type:</b> - <b>Min</b> 0.00 [Hz]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3000.00 [Hz]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6310 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Hz]
<b>Description:</b>	Sets the starting frequency of the slip compensation.		

**Note:** For p1334 = 0, the starting frequency of the slip compensation is automatically set to 6 % of the rated motor frequency.

<b>p1335[0...n]</b>			
<b>Slip compensation, scaling / Slip comp scal</b>			
VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 1690, 6310
	<b>P-Group:</b> U/f open-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> PEM, REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.0 [%]	600.0 [%]	0.0 [%]
<b>Description:</b>	Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip). p1335 = 0.0 %: Slip compensation de-activated. p1335 = 100.0 %: The slip is completely compensated.		
<b>Dependency:</b>	Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335. For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.		
<b>Note:</b>	The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors. For synchronous motors, this effect does not occur and the parameter has no effect in this case. For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency. If p1335 is changed during commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

<b>Description:</b>	Sets the filter time constant for resonance damping for U/f control.		
<b>Dependency:</b>	Refer to: p1300, p1338, p1349		
<b>p1340[0...n]</b>	<b>I_max frequency controller proportional gain / I_max_ctrl Kp</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> U/f open-loop control <b>Not for motor type:</b> - <b>Min</b> 0.000	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 0.500	<b>Access level:</b> 3 <b>Func. diagram:</b> 1690 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.000
<b>Description:</b>	<p>Sets the proportional gain of the I_max frequency controller.</p> <p>The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded.</p> <p>In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time).</p>		
<b>Dependency:</b>	In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used.		
<b>Notice:</b>	<p>When de-activating the I_max controller, the following must be carefully observed:</p> <p>When the maximum current (r0067) is exceeded, the output current is no longer reduced, however, overcurrent alarm messages are generated. The drive is shut down if the overcurrent limit (r0209) is exceeded.</p>		
<b>Note:</b>	<p>The I_max limiting controller becomes ineffective if the ramp-function generator is de-activated with p1122 = 1.</p> <p>p1341 = 0: I_max frequency controller de-activated and I_max voltage controller activated over the complete speed range.</p>

**p1350[0...n] Soft starting / Soft starting**

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 1690
	<b>P-Group:</b> U/f open-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0

**Description:** Sets whether the voltage is continuously increased during the magnetizing phase (p1350 = 1, On) or whether it jumps directly to the voltage boost (p1350 = 0, Off).

**Value:** 0: OFF  
1: ON

**Note:** The settings for this parameter have the following advantages and disadvantages:  
0 = off (jump directly to voltage boost)  
Advantage: Flux is established quickly -> torque is quickly available  
Disadvantage: The motor can move while it is being magnetized  
1 = on (voltage is continually established)  
Advantage: The motor is unlikely to rotate  
Disadvantage: The flux is established slower -> torque is available later

<b>p1351[0...n]</b>	<b>CO: Motor holding brake starting frequency / Brake f_start</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> U/f open-loop control <b>Not for motor type:</b> REL <b>Min</b> -300.00 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> 300.00 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6310 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [%]
<b>Description:</b>	Sets the frequency setting value at the slip compensation output for starting up with motor holding brake.		
<b>Dependency:</b>	When setting p1351 > 0, then slip compensation is automatically activated (p1335 = 100 %).		
<b>Notice:</b>	A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.		
<b>Note:</b>	A value of 100% corresponds to the motor rated slip (r0330).		
<b>p1356[0...n]</b>	<b>CI: U/f control, angular setpoint / Uf ang setpoint</b>

	<b>P-Group:</b> U/f open-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> PERCENT	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [%]	100.00 [%]	25.00 [%]

**Description:** Sets the percentage value for the asymmetry detection for the braking chopper.

**Dependency:** Select operation with braking resistor: p1300 = 15  
Refer to: p1360, p1362, r1363  
Refer to: F06922

**Note:** Zero means no asymmetry detection.

**p1400[0...n] Speed control configuration / n\_ctrl config**

VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 6490
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 0000 0000 0000 1000 0000 0010 0001 bin

**Description:** Sets the configuration for the closed-loop speed control.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Automatic Kp/Tn adaptation active	Yes	No	6040
	01	Sensorless vector control freeze I comp	Yes	No	6040
	02	Acceleration pre-control source	External (p1495)	Internal (n_set)	6031
	03	Reference model speed setpoint, I component	ON	OFF	6031
	05	Kp/Tn adaptation active	Yes	No	6040
	06	Free Tn adaptation active	Yes	No	6050
	14	Torque pre-control	Always active	For n_ctrl enab	6060
	15	Sensorless vector control, speed pre-control	Yes	No	6030
	16	I component for limiting	Enable	Hold	6030
	19	Anti-windup for integral component	Yes	No	6030
	20	Acceleration model	ON	OFF	6030

**Note:** Re bit 01:  
When the bit is set, the I component of the speed controller is kept when changing into the open-loop controlled mode.

Re bit 16:  
When the bit is set, the integral component of the speed controller is only held if it reaches the torque limit.

Re bit 19:  
When this bit is set, speed overshoots when accelerating along the torque limit and for load surges are reduced. If the setpoint torque reaches the torque limit, then the integral component is set to the difference between the torque limit and P component.

Re bit 20:  
The acceleration model for the speed setpoint is only active for encoderless vector control if p1496 is not zero.

**p1401[0...n] Flux control configuration / Flux ctrl config**

VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 6491
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 0000 0000 1110 bin

**Description:** Sets the configuration for flux setpoint control

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Flux setpoint soft starting active	Yes	No	6722, 6725
	01	Flux setpoint differentiation active	Yes	No	6723, 6726
	02	Flux build-up control active	Yes	No	6722, 6723, 6725, 6726
	03	Flux characteristic, load-dependent	Yes	No	6725
	04	Flux controller (ASM with encoder)	Yes	No	-
	05	Flux impression (ASM with encoder)	with model chngov	From 30 % n Rated	-
	06	Quick magnetizing	Yes	No	6722

07	Pre-control speed limitation	Yes	No	6640
08	Speed limiting controller	With M_limits	With I_limits	6640

**Note:**

Re bit 00 (only for induction motors)

Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346.

Re bit 01 (only for induction motors)

Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346. When quick magnetizing (p1401.6 = 1) is selected, soft starting is internally de-activated and alarm A07416 is displayed.

The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds.

Re bit 02 (only for induction motors)

The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.

Re bit 03:

The load-dependent calculation of the flux characteristic is only available for separately-excited synchronous motors.

Re bit 04 (only for induction motors with encoder):

The flux controller does not operate in the range of the current model and not in the range of the flux impression (refer to p1750.4).

Re bit 05 (only for induction motors with encoder):

Extremely rugged control operation is possible by directly toggling between the current model and flux impression. We therefore recommend that, in addition, the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 \* p0311; p1753 = 5 %).

Re bit 06 (not for induction motors):

Magnetizing is performed with maximum current (0.9 \* r0067). With active identification of the stator resistance (see p0621) quick magnetizing is internally de-activated and alarm A07416 is displayed. During a flying restart of a rotating motor (see p1200) no quick magnetizing takes place.

Re bit 07:

if the speed of the drive exceeds the effective speed limit of the speed limiting controller, the torque limit is reduced linearly to zero as the deviation becomes greater. This reduces the integral component of the speed controller and, in turn, the overshoot during load shedding (see also F07901 and p2162).

Re bit 08:

The speed limiting controller sets the speed to maximum by opening the torque limits as far as the current limits (bit 8 = 0) or taking the torque limits into account (bit 8 = 1).

p1402[0...n]		Closed-loop current control and motor model configuration / I_ctrl config			
VECTOR_G (n/M)	Can be changed: U, T		Calculated: CALC_MOD_REG		Access level: 3

	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.0	<b>Max</b> 3.0	<b>Factory setting</b> 0.0
<b>Description:</b>	Sets the dead time to symmetrize the speed setpoint for active torque pre-control. The selected multiplier refers to the speed controller clock cycle (dead time= p1428 * p0115[1]).		
<b>Dependency:</b>	In conjunction with p1429, this parameter can emulate the characteristics of how the torque is established (dynamic response of closed current control loop). The parameter is only effective if the acceleration model is supplied using external acceleration signals (p1400.2 = 1). For p1400.2 = 0, a fixed dead time is used. Refer to: p1429, p1511		

p1429[0...n]	Speed pre-control balancing time constant / n_prectr bal T		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 5030, 5042, 5210, 6031
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.00 [ms]	<b>Max</b> 10000.00 [ms]	<b>Factory setting</b> 0.00 [ms]
<b>Description:</b>	Sets the time constant (PT1) for symmetrizing the speed setpoint for active torque pre-control.		
<b>Dependency:</b>	In conjunction with p1428, this parameter can emulate the characteristics of how torque is established (dynamic response of the closed current control loop).		

For VECTOR (r0107) the following applies:

The parameter is only effective if the acceleration model is supplied using external acceleration signals (p1400.2 = 1). For p1400.2 = 0, time constant p1442 (or p1452 for sensorless vector control) is used.

Refer to: p1428, p1511

<b>r1431</b>	<b>CO: Speed pre-control to motor model / n_prectrl mot_mod</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> - [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 3_1 <b>Scaling:</b> p2000 <b>Max</b> - [rpm]	<b>Access level:</b> 4 <b>Func. diagram:</b> 6030 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [rpm]
<b>Description:</b>	Displays the speed setpoint for pre-controlling the motor model with sensorless vector control.		
<b>Note:</b>	With p1400 bit 15 = 0 or encoderless torque control, the pre-control signal is kept continuously in the range of the voltage model.		
<b>p1433[0...n]</b>	<b>Speed controller reference model natural frequency / n_ctrl RefMod fn</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.0 [Hz]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 8000.0 [Hz]	<b>Access level:</b> 3 <b>Func. diagram:</b> 5030, 6031 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [Hz]
<b>Description:</b>	Sets the natural frequency of a PT2 element for the reference model of the speed controller.		
<b>Recommend.:</b>	The reference model is correctly set when the characteristics of p1439 (reference model output) and p1445 (actual speed value) are virtually identical when the I component of the speed controller is disabled.		
<b>Dependency:</b>	Together with p1434 and p1435, the characteristics (in the time domain) of the closed-loop speed control (P) can be emulated. For VECTOR (r0107) the following applies: The reference model is activated with p1400.3 = 1. For sensorless vector control (p1300 = 20) the reference model is disabled in open-loop speed controlled operation (refer to p1755). Refer to: p1434, p1435

<b>Description:</b>	Sets the damping of a PT2 element for the reference model of the speed controller.		
<b>Recommend.:</b>	The reference model is correctly set when the characteristics of p1439 (reference model output) and p1445 (actual speed value) are virtually identical when the I component of the speed controller is disabled.		
<b>Dependency:</b>	In conjunction with p1433 and p1435, the characteristics (in time) of the P-controlled speed control loop can be emulated. For VECTOR (r0107) the following applies: The reference model is activated with p1400.3 = 1. Refer to: p1433, p1435		

<b>p1435[0...n]</b>	<b>Speed controller reference model dead time / n_ctrRefMod t_dead</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.00	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3.00	<b>Access level:</b> 2 <b>Func. diagram:</b> 5030, 6031 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00
<b>Description:</b>	Sets the "fractional" dead time for the reference model of the speed controller. This parameter emulates the computing dead time of the proportionally controlled speed control loop. The selected multiplier refers to the speed controller clock cycle (dead time= p1435 * p0115[1]).		
<b>Recommend.:</b>	The reference model is correctly set when the characteristics of p1439 (reference model output) and p1445 (actual speed value) are virtually identical when the I component of the speed controller is disabled.		
<b>Dependency:</b>	In conjunction with p1433 and p1434, the characteristics (in time) of the P-controlled speed control loop can be emulated. For VECTOR (r0107) the following applies: The reference model is activated with p1400.3 = 1. Refer to: p0115, p1433, p1434		
<b>r1436</b>	<b>CO: Speed controller reference model speed setpoint output / RefMod n_set outp</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> - [rpm]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 3_1 <b>Scaling:</b> p2000 <b>Max</b> - [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> 5030, 6031 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [rpm]
<b>Description:</b>	Displays the speed setpoint at the output of the reference model.		
<b>Dependency:</b>	For VECTOR (r0107) the following applies: The reference model is activated with p1400.3 = 1.		
<b>p1437[0...n]</b>	<b>CI: Speed controller, reference model I component input / n_ctrRefMod I_comp</b>

<b>Description:</b>	Displays the speed setpoint for the I component of the speed controller (output of the reference model after the set-point limiting).		
<b>Dependency:</b>	Refer to: r1438		
<b>Note:</b>	In the standard state (the reference model is de-activated), r1438 = r1439.		

<b>p1440[0...n]</b>	<b>CI: Speed controller speed actual value / n_ctrl n_act</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> p2000 <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 6040 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 63[0]
<b>Description:</b>	Sets the signal source for the speed actual value of the speed controller.		
<b>Dependency:</b>	Refer to: r1443		
<b>Danger:</b>	When using external speed actual values for the speed controller, for a direction of rotation change via p1821 = 1, then its polarity must also be changed, e.g. for an encoder DO via p0410. Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.		
			
<b>Caution:</b>	Speed control with encoder (p1300 = 21):		
	For the speed or position signal of the motor model there must always be a motor encoder available (evaluation via SMC/SMI, see p0400). The actual speed of the motor (r0061) and the position data for synchronous motors continue to come from this motor encoder and are not affected by the setting of p1440.		
	Interconnection of p1440:		
	If connector input p1440 is interconnected with an external speed actual value, the identical scaling of the speed should be observed (p2000).		
<b>Notice:</b>	Speed control without encoder (p1300 = 20):		
	Dependent upon the transmission path of the external speed signal there will be dead times which have to be taken into account when setting the speed controller parameters (p1470, p1472) and can lead to dynamic losses accordingly. It is for this reason that signal transmission times have to be kept as low as possible.		
	So that the speed controller can also work at standstill, set p1750.2 = 1 (closed-loop operation from zero speed for passive loads). If you do not make this setting, operation will switch to open-loop speed control in the low speed range, switching the closed-loop speed controller off and rendering the measured actual speed ineffective.		
<b>Note:</b>	Speed control with encoder (p1300 = 21):		
	An external speed signal should, on the average, correspond to the speed of the motor encoder (r0061).		

<b>p1441[0...n]</b>	<b>Actual speed smoothing time / n_act T_smooth</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.00 [ms]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000.00 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 4710, 4715 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [ms]
<b>Description:</b>	Sets the smoothing time constant (PT1) for the speed actual value.		

**Dependency:** Refer to: r0063

**Notice:** Smoothing times above 20 ms are only possible if the drive is accelerated or braked with the appropriately long ramp-up/ramp-down times. Otherwise, significant torque errors can occur and there is the danger that the drive is powered down (tripped) with F07902 (motor stalled).

**Note:** The speed actual value should be smoothed for encoders with a low pulse number or for resolvers.  
After this parameter has been changed, we recommend that the speed controller is adapted and/or the speed controller settings checked Kp (p1460) and Tn (p1462).

---

**p1442[0...n] Speed controller speed actual value smoothing time / n\_ctr n\_act T\_smth**

<b>Description:</b>	Sets the P gain for encoderless operation for the speed controller.		
<b>Dependency:</b>	For p0528 = 1, the speed controller gain is represented without any dimensions.		
<b>Note:</b>	The product p0341 x p0342 is taken into account when automatically calculating the speed controller (p0340 = 1, 3, 4).		
<b>p1472[0...n]</b>	<b>Speed controller encoderless operation integral time / n_ctrl SLVC Tn</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.0 [ms]	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100000.0 [ms]	<b>Access level:</b> 2 <b>Func. diagram:</b> 6040, 6050 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 20.0 [ms]
<b>Description:</b>	Set the integral time for encoderless operation for the speed controller.		
<b>Note:</b>	The integral component is stopped if the complete controller output or the sum of controller output and torque pre-control reach the torque limit.		
<b>p1475[0...n]</b>	<b>CI: Speed controller torque setting value for motor holding brake / n_ctrl M_sv MHB</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> p2003 <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 6040 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the torque setting value when starting up with motor holding brake.		
<b>Recommend.:</b>	To hold the actual torque when stopping the motor, you are advised to set p1400 bit 1 = 1. As a result, the integral component of the speed controller is frozen when changing to the open-loop controlled operating range.		
<b>Dependency:</b>	The switching in of the torque setting value for the motor holding brake has a higher priority than the setting of the integrator value using p1477 and p1478.		
<b>Note:</b>	The setting of the integral output of the speed controller begins after magnetizing (see p0346, r0056 bit 4) and ends at the end of the brake control opening time p1216. A setting value of zero means that no setting procedure will take place.

	<b>Not for motor type:</b> REL	<b>Scaling:</b> p2003	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0
<b>Description:</b>	Sets the signal source for the integrator setting value for the velocity controller. The signal to set this integrator setting value is interconnected via p1477.		
<b>Dependency:</b>	The setting value of the speed controller integrator is weighted with the scaling factor of the signal source in p1479. If p1478 is interconnected to the integral output of the speed controller (r1482), then after the magnetizing time (r0346) and if the speed controller is enabled, the integral component of the controller is set to the last value before the pulse inhibit. This value is set if no setting command (p1477) is interconnected or, at the instant that the pulses were inhibited, a setting command is available, which is not de-activated up to the next time that the pulses are inhibited. For sensorless vector control, in addition p1400.1 should be set to 1 so that when the drive is stopped, the integral component of the speed controller is not controlled down to zero. In order that when setting the integrator output, only the static torque is detected, we recommend that the accelerating torque is completely pre-controlled (e.g. p1496). If p1478 is interconnected to another output other than r1482, then after magnetizing and speed controller enable, the integral output is set once if the setting command is not interconnected (p1477 = 0). Refer to: p1477, p1479		
<b>Notice:</b>	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	3	0

**Description:** Sets the source for droop feedback.

With increasing torque, the speed setpoint is reduced (enabled using p1492), so that for mechanically coupled drives a load equalization (load compensation) is obtained. A load difference compensation is also possible, if p1486 is connected with the torque setpoint of the other drive.

**Value:**

- 0: Droop feedback not connected
- 1: Droop from torque setpoint
- 2: Droop from speed controller output
- 3: Droop from integral output, speed controller

**Dependency:** Refer to: p1486, p1487, p1489, r1490, p1492

**Caution:** For active acceleration precontrol of the speed controller (refer to p1496), it is not recommended that p1488 is set to 1, as this could result in positive coupling effects. Instead of this, as source of the droop feedback, the output signal of the speed controller should be used, which generally sets the load torque.

**p1489[0...n]      Droop feedback scaling / Droop scaling**

VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3

	- [rpm]	- [rpm]	- [rpm]

**Description:** Displays the output signal of the droop calculation. The droop feedback result is subtracted from the speed setpoint when activated (p1492).

**Dependency:** Refer to: p1486, p1487, p1488, p1489, p1492

<b>p1492[0...n]</b>	<b>BI: Droop feedback enable / Droop enable</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 / Binary <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 2520, 6030 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Enables the droop to be applied to the speed/velocity setpoint.		
<b>Dependency:</b>	Refer to: p1486, p1487, p1488, p1489, r1490		
<b>Note:</b>	Even when not enabled, the droop speed is calculated but not subtracted from the setpoint speed. This makes it possible to subtract the result of this calculation from the speed of another drive.		
<b>r1493</b>	<b>CO: Moment of inertia, total / M_inertia total</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> - [kgm <sup>2</sup> ]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 25_1 <b>Scaling:</b> - <b>Max</b> - [kgm <sup>2</sup> ]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6031 <b>Unit selection:</b> p0100 <b>Expert list:</b> 1 <b>Factory setting</b> - [kgm <sup>2</sup> ]
<b>Description:</b>	Displays the parameterized total moment of inertia ((p0341 * p0342) + p1496) without evaluation by the scaling via p1497.		
<b>p1495[0...n]</b>	<b>CI: Acceleration pre-control / a_prectrl</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> p2007 <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 6031 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the acceleration pre-control.		
<b>Dependency:</b>	The signal source for the acceleration is activated with p1400.2 = 1. For p1400.2 = 0, the acceleration pre-control is calculated from the speed setpoint change from r0062. For p1400.2 = 0 and activate reference model (p1400.3 = 1) the acceleration pre-control is switched out. Refer to: p1400, p1496		
<b>Note:</b>	If the acceleration is entered as external signal, then the accelerating torque is calculated as follows (r1518): $r1518 = \text{acceleration (\% of p2007)} / 100 \% * (p2007 * 60 \text{ s}) / p0311 * r0345 / 1 \text{ s} * r0333$		
<b>p1496[0...n]</b>	<b>Acceleration pre-control scaling / a_prectrl scal</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.0 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.0 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 1700, 6031 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [%]
<b>Description:</b>	Sets the scaling for the acceleration pre-control of the speed/velocity controller.		
<b>Dependency:</b>	When the reference model is activated (p1400.3 = 1) and for an internal acceleration pre-control (p1400.2 = 0), the acceleration pre-control is switched out (disabled). The reference model (p1400.3 = 1) and external acceleration pre-control (p1400.2 = 1) can be operated together. Refer to: p0341, p0342		

**Warning:**

The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0).

The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).

**Note:**

The parameter is set to 100% by the rotating measurement (refer to p1960).

The acceleration pre-control may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled.

We also recommend that the pre-control mode is not used if there is gearbox backlash.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	50.0 [%]	200.0 [%]	100.0 [%]

**Description:** Sets the flux setpoint referred to rated motor flux.

**Notice:** A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

**Note:** For p1570 > 100%, the flux setpoint increases as a function of the load from 100% (no-load operation) to the setting in p1570 (above rated motor torque), if p1580 > 0% has been set.

<b>p1571[0...n]</b>	<b>CI: Supplementary flux setpoint / Suppl flux setp</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 / FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> CDS, p0170 <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 6725 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the supplementary flux setpoint.		
<b>Notice:</b>	Low flux setpoints can cause the drive to stall at higher loads. This is the reason that the flux setpoint should only be adapted for slow load changes.		
<b>Note:</b>	The supplementary flux setpoint is limited to +/- 50 %.		
<b>p1572[0...n]</b>	<b>Supplementary flux setpoint / Suppl flux setp</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 0.0 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> 100.0 [%]	<b>Access level:</b> 4 <b>Func. diagram:</b> 6726 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [%]
<b>Description:</b>	Sets the supplementary flux setpoint for the flux controller. The value is referred to the rated motor flux.		
<b>Notice:</b>	The parameter should be set back to 0% again for normal closed-loop control operation.		
<b>Note:</b>	The parameter is used to optimize the flux controller. The current model is not influenced by the setting.		
<b>p1573[0...n]</b>	<b>Flux threshold value magnetizing / Flux thresh magnet</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> PEM, REL <b>Min</b> 10.0 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> PERCENT <b>Max</b> 200.0 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6722 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100.0 [%]
<b>Description:</b>	Sets the flux threshold value for enabling the speed setpoint and the end of magnetizing (r0056.4).		
<b>Note:</b>	The parameter only has an influence if the flux actual value reaches the threshold value p1573 more quickly during magnetizing than the time set in p0346. The parameter has no influence for flying restart (see p1200) and after DC braking (see p1231).		
<b>p1574[0...n]</b>	<b>Voltage reserve dynamic / U_reserve dyn</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.0 [Vrms]	<b>Calculated:</b> CALC_MOD_LIM_REF <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 5_1 <b>Scaling:</b> - <b>Max</b> 150.0 [Vrms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6723, 6724 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 10.0 [Vrms]
<b>Description:</b>	Sets a dynamic voltage reserve.		
<b>Note:</b>	In the field weakening range, it must be expected that the control dynamic performance is somewhat restricted due to the limited possibilities of controlling/adjusting the voltage. This can be improved by increasing the voltage reserve. Increasing the reserve reduces the steady-state maximum output voltage (r0071).		

<b>p1576[0...n]</b>	<b>Flux boost, adaptation speed, lower / Flux boost n lower</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 0.00 [rpm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 3_1 <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6725 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [rpm]
<b>Description:</b>	Sets the lower adaptation speed of the flux boost. Below this speed, p1570 is set as reference (setpoint) flux.		
<b>p1577[0...n]</b>	<b>Flux boost adaptation speed, upper / Flux boost n upper</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 1.0 [%]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 10000.0 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6725 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 200.0 [%]
<b>Description:</b>	Sets the upper adaptation speed of the flux boost. Above this speed, the rated motor flux (100 %) is set as reference (setpoint) flux.		
<b>Dependency:</b>	The parameter value refers to the lower adaptation speed of the flux boost. Refer to: p1576		
<b>p1580[0...n]</b>	<b>Efficiency optimization / Efficiency opt.</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100 [%]	<b>Access level:</b> 2 <b>Func. diagram:</b> 6722 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0 [%]
<b>Description:</b>	Sets the efficiency optimization. When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load. For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.		
<b>Note:</b>	It only makes sense to activate this function if the dynamic response requirements of the speed controller are low. In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp). Further, the smoothing time of the flux setpoint filter (p1582) should be increased.		
<b>p1582[0...n]</b>	<b>Flux setpoint smoothing time / Flux setp T_smth</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32  <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 4 [ms]	<b>Calculated:</b> CALC_MOD_REG <b>Dynamic index:</b> DDS, p0180  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 5000 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6722, 6724, 6725  <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 15 [ms]
<b>Description:</b>	Sets the smoothing time for the flux setpoint.		

**r1583 Flux setpoint smoothed / Flux setp smooth**

<b>p1599[0...n]</b>	<b>Flux controller, excitation current difference / Flux ctr I_exc_dif</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 0.0 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100.0 [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 3.0 [%]
<b>Description:</b>	Sets the permissible difference between the actual excitation current and the excitation current setpoint. The excitation current flux controller is active within this difference. If the difference lies outside the specified limit value, then the I component of the excitation current flux controller is kept. Instead of this, for the flux controller of the field-generating current, an additional I controller is switched in (integral time according to p1592). If the difference again lies within the bandwidth, the I component of the excitation current flux controller is re-activated and the I component of the flux controller of the field-generating current is reduced as an exponential function with respect to time. The reduction of the I component over time depends on the rotor time constant (r0384).		

<b>p1600[0...n]</b>	<b>P flux controller, P gain / P flux ctrl Kp</b>

<b>I/f operation current setpoint / I/f op I_setp</b>			
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 6_2 <b>Scaling:</b> - <b>Max</b> 10000.00 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> 6727 <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the stator current setpoint for operation of a separately-excited synchronous motor (FEM) in operating mode I/f (p1300 = 18).		

<b>p1610[0...n]</b>	<b>Torque setpoint static (SLVC) / M_set static</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32  <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> -200.0 [%]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 200.0 [%]	<b>Access level:</b> 2 <b>Func. diagram:</b> 1710, 6721, 6722, 6726 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 50.0 [%]
<b>Description:</b>	Sets the static torque setpoint for sensorless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque (r0333). For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.		
<b>Notice:</b>	p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur.		
<b>Note:</b>	For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current). For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque. Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors.		
<b>p1611[0...n]</b>	<b>Supplementary accelerating torque (SLVC) / M_suppl_accel</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32  <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> REL <b>Min</b> 0.0 [%]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 200.0 [%]	<b>Access level:</b> 2 <b>Func. diagram:</b> 1710, 6721, 6722, 6726 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 30.0 [%]
<b>Description:</b>	Enters the dynamic torque setpoint for the low-speed range for sensorless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque (r0333).		
<b>Note:</b>	When accelerating and braking p1611 is added to p1610 and the resulting total torque is converted into an appropriate current setpoint and controlled. For pure accelerating torques, it is always favorable to use the torque pre-control of the speed controller (p1496).		
<b>p1612[0...n]</b>	<b>Current setpoint magnetizing open-loop controlled / Id_set ctrl</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, PEM, REL <b>Min</b> 0.00 [Arms]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> 6_2 <b>Scaling:</b> - <b>Max</b> 10000.00 [Arms]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [Arms]
<b>Description:</b>	Sets the magnetizing current setpoint in the open-loop controlled encoderless operation. The value is only valid during the current model orientation.		
<b>Dependency:</b>	Refer to: p1610, p1611		
<b>Note:</b>	The value is effective at speeds less than p1755 and represents a reserve for a possibly existing load torque or torque error in the moment of inertia.		

**r1614 EMF maximum / EMF max**

VECTOR_G (n/M)	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 4
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 6725
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> 5_1	<b>Unit selection:</b> p0505
	<b>Not for motor type:</b> ASM, PEM, REL	<b>Scaling:</b> p2001	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [Vrms]	- [Vrms]	- [Vrms]

**Description:** Displays the actual maximum possible electromotive force (EMF) of the separately-excited synchronous motor.

**Dependency:** The value is the basis for the flux setpoint.

The maximum possible EMF depends on the following factors:

- Actual DC link voltage (r0070).
- Maximum modulation depth (p1803).
- Field-generating and torque-generating current setpoint.

**p1616[0...n] Current setpoint smoothing time / I\_set T\_smooth**

VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> CALC_MOD_REG	<b>Access level:</b> 3

<b>p1750[0...n] Motor model configuration / MotMod config</b>					
VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> CALC_MOD_LIM_REF	<b>Access level:</b> 3		
	<b>Data type:</b> Unsigned8	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> -		
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -		
	<b>Not for motor type:</b> REL, FEM	<b>Scaling:</b> -	<b>Expert list:</b> 1		
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> 0000 0000 bin		
<b>Description:</b>	Sets the configuration for the motor model. Bit 0 = 1: Forces open-loop speed-controlled starting (ASM). Bit 1 = 1: Forces the system to pass through frequency zero, open-loop-controlled (ASM). Bit 2 = 1: Drive remains in full closed-loop control mode, even at zero frequency (ASM). Bit 3 = 1: Motor model evaluates the saturation characteristic (ASM). Bit 4 = 1: Time-controlled change between current and observer models (ASM). Bit 5 = 1: HF signal injection to estimate the continuous rotor position (PESM). Bit 6 = 1: If the motor is blocked, sensorless vector control remains speed-controlled (ASM). Bit 7 = 1: Use rugged switchover limits to switchover the model between open-loop and closed-loop controlled operation (ASM).				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Controlled start	Yes	No	-
	01	Controlled through 0 Hz	Yes	No	-
	02	Closed-loop ctrl oper. down to zero freq. for passive loads	Yes	No	-
	03	Motor model Lh_pre = f(PsiEst)	Yes	No	-

04	Model changeover	Time controlled	Freq. controlled	-
05	Cl.-loop control mode PESM up to f=0Hz with HF signal injection	Yes	No	-
06	Closed-loop control when motor is blocked	Yes	No	-
07	Use rugged changeover limits	Yes	No	-

**Caution:****Note:**

Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should de-activate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).

Bit 0 ... 3 only have influence for sensorless vector control, bit 4 only for vector control with encoder. Bit 2 is pre-assigned depending on p0500.

Re bit 2 = 1:

The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.

This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.

If bit 2 = 1, then bit 3 is automatically set to 1. Manual de-selection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.

When the bit is set, the selection of bits 0 and 1 is ignored.

Re bit 2 = 0:

If the model feedback is deactivated (p1784 = 0), with bit 2 = 0, then bit 3 is also automatically set to 0.

Re bit 5 = 1:

The selection of HF signal injection is only relevant for permanent-magnet synchronous motors (PESM). Therefore, activation of bit 5 is only possible outside of motor commissioning (p0010 = 0).

In order to achieve user-friendly configuration of the power unit components in the oversampling mode, when activated for the first time, initially p1810 bit 3 is set, and then an automatic system boot is initiated. This is only possible if all of the axes connected to the CU are switched off (refer to the setting conditions for p0009); otherwise, it is not possible to set the bit.

When deactivating p1750 bit 5, p1810 bit 3 remains unchanged and the system does not boot again.

Therefore, to reverse configure the power unit components from the oversampling mode (after manually deselecting p1750 bit 5) then initially p1810 bit 3 must be manually deleted and then a manual warm restart initiated.

As an alternative to a warm restart: save the parameters and carry out a POWER ON (switch-off/switch-on).

When the function "safety without encoder" (p9306/p9506) is activated, this setting is not permissible and results in monitoring errors.

Re bit 6 = 1:

The following applies for encoderless vector control of induction motors:

For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.

Re bit 7 = 1:

The following applies for encoderless vector control of induction motors:

If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount p1749 \* p1755.

The effective time condition for changing over into open-controlled operation is obtained from the minimum of p1758 and  $0.5 * r0384$ .

Activation can make sense for applications that demand a high torque at low frequencies and therefore low speed gradients.

It must be ensured that p1610, p1611 have been adequately parameterized.

---

-

-

-

**Description:**

Displays the status of the motor model.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Controlled operation	Active	Inactive	6721
	01	Set ramp-function generator	Active	Inactive	-
	02	Stop RsLh adaptation	Yes	No	-
	03	Feedback	Active	Inactive	-
	04	Encoder operation	Active	Inactive	-
	05	Holding angle	Yes	No	-
	06	Acceleration criterion	Active	Inactive	-
	07	Set angular integrator PEM	No	Yes	-
	08	Stop Kt adaptation PEM	No	Yes	-
	09	PollD active PEM SLVC	No	Yes	-
	10	I injection PEM	No	Yes	-
	11	Speed controller output cannot be set to zero	Yes	No	-
	12	Rs adapt waits	Yes	No	-
	13	mot oper	Yes	No	-
	14	Stator frequency sign	Positive	Negative	-
	15	Torque sign	Motor mode	Regenerative mode	-
	16	Pulse injection active PEM	Yes	No	-
	17	Operation with rugged model feedback	Enabled	Inhibited	-
	18	Operation of the current model with current feedback	Enabled	Inhibited	-
	19	Current feedback in the current model	Active	Inactive	-
	20	Rugged increase of the changeover limits	Active	Inactive	-

**Note:**

Re bit 17:

Displays the status when enabling the rugged model feedback (p1784) for operation with and without encoder. The feedback is used to increase the parameter ruggedness of the motor model and is effective in the operating range of the two-component closed loop current control.

Re bit 18:

Displays the status when enabling the differential current feedback in the current model for operation with encoder. The function is automatically enabled with p1784 > 0 or p1731 > 0. The feedback is used for a rugged change between the current model and complete machine model with active rugged model feedback and combination current.

Re bit 19:

Displays the currently active stator circuit feedback in current model operation.

Re bit 20:

Displays the currently effective increase of the changeover limits by the value p1749 \* p1755.

	<b>Not for motor type:</b> PEM, REL, FEM	<b>Scaling:</b> PERCENT	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [%]	- [%]	- [%]

**Description:** Displays the absolute value of the flux of the motor model.

---

### p1780[0...n] Motor model adaptation configuration / MotMod adapt conf

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> -
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 0000 0111 1100 bin

**Description:** Sets the configuration for the adaptation circuit of the motor model.  
 Induction motor (ASM): Rs, Rr (only for operation with encoder), Lh and offset compensation.  
 Permanent magnet synchronous motor (PEM): kT

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	Select motor model ASM Rs adaptation	Yes	No	-
	02	Select motor model ASM Lh adaptation	Yes	No	-
	03	Select motor model PEM kT adaptation	Yes	No	-
	04	Select motor model offset adaptation	Yes	No	-

05	Select ASM Rr adaptation (only with encoder)	Yes	No	-
06	Select pole position identification PEM encoderless	Yes	No	-
07	Select T(valve) with Rs adaptation	Yes	No	-
10	Filter time combination current like current ctrl integral time	Yes	No	-

**Dependency:** In U/f characteristic operating mode only bit 7 is relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

When the power units are connected in parallel with separate, offset motor winding systems (p7003 = 2), then the compensation of the valve interlocking times should be implemented as Rs adaptation (bit 7 = 1).

**Note:** ASM: Induction motor

PEM: Permanent magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

---

#### p1784[0...n] Motor model feedback scaling / MotMod fdbk scal

VECTOR_G (n/M)	<b>Can be changed:</b> U, T	<b>Calculated:</b> CALC_MOD_CON	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> -
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> PEM, REL, FEM	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.0 [%]	<b>Max</b> 1000.0 [%]	<b>Factory setting</b> 0.0 [%]

**Description:** Sets the scaling for model fault feedback.

**Note:** Feeding back the measured model fault to the model states increases the control stability and makes the motor model rugged against parameter errors.

When feedback is selected (p1784 > 0), Lh adaptation is not effective.

<b>p1798[0...n]</b>	<b>Motor model pulse technique speed adaptation Kp / MotMod pulses Kp</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> ASM, REL, FEM <b>Min</b> 0.000	<b>Calculated:</b> CALC_MOD_CON <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000.000	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1.000
<b>Description:</b>	Sets the proportional gain Kp for speed adaptation with active pulse technique for the estimation of the continuous rotor position.		
<b>p1800[0...n]</b>	<b>Pulse frequency setpoint / Pulse freq setp</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Modulation <b>Not for motor type:</b> - <b>Min</b> 1.000 [kHz]	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 16.000 [kHz]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 4.000 [kHz]
<b>Description:</b>	Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned.		
<b>Dependency:</b>	The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values: $p1800 = 1000 / (p0115[0] * 2)$ or $p1800 = n * 1000 / p0115[0]$ with $n = 1, 2, 3, \dots$ Example: $p0115[0] = 250 \mu s \rightarrow p1800 = 2, 4, 8, 12, 16 \text{ kHz}$ Possible setting values can be taken from r0114 (if p0009 = p0010 = 0). If p0092 = 1 the sampling times p0115 and the pulse frequency p1800 are checked every time the parameters are downloaded, and reset to the initial values if necessary. This check can be de-activated by setting p0092 = 0 (making this setting does not affect isochronous PROFIBUS operation). If wobulation is selected (p1810.2), the pulse frequency can only be changed as part of pulse enabling to values with the following ratio: a) $p1800 \leq 1000 / p0115[0]$ for $p1811 > 0 \%$ b) $p1800 \leq 1000 * 2 / p0115[0]$ for $p1811 = 0 \%$ Under pulse inhibit $p1800 > 1000 / p0115[0] \rightarrow p1811 = 0$ $p1800 > 1000 * 2 / p0115[0] \rightarrow p1810.2 = 0$ and $p1811 = 0$ (applicable for all indices) Refer to: r0110, r0111, p0112, p0113, r0114, p0115, p0230, p1817		
<b>Notice:</b>	The pulse frequency p1800 can also be asynchronously set to the current controller clock cycle (0.05 kHz increment). To do this, p1810 bit 12 must be set to 1 (secondary condition, see p1810). Effects: - switchover of the gating unit (p1810 bit 2) - current actual value correction is activated (p1840 bit 0) - minimum pulse frequency $1000 * 0.5 / p0115[0]$ - maximum pulse frequency $1000 * 2 / p0115[0]$ - fluctuating deadtimes and dynamic performance in the current control loop - increased level of current ripple in the current display		

**Note:** The maximum possible pulse frequency is also determined by the power unit being used.  
When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).  
The maximum pulse frequency for operation with output reactors (see p0230) is 4 kHz for booksize and blocksize power units, for chassis power units it is twice the rated pulse frequency (2.5 kHz or 4 kHz).  
If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter. If an external sine-wave filter is parameterized, (p0230 = 4), then the minimum pulse frequency is calculated as follows:  
$$f_{\text{puls\_min}} = 1.6 / (2 * \text{Pi} * \text{root}(p0233 * p0234 * p0235))$$
, with p0233 in H and p0234 in F  
In this case, the pulse frequency must be a multiple of the inverse value of the current controller sampling time (p0115[0]).  
If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be changed below the minimum value required for the filter.  
If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

<b>r1801[0...1] CO: Pulse frequency / Pulse frequency</b>			
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Displays, signals <b>Not for motor type:</b> - <b>Min</b> - [kHz]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> p2000 <b>Max</b> - [kHz]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [kHz]
<b>Description:</b>	Display and connector output for the actual converter switching frequency.		
<b>Index:</b>	[0] = Actual [1] = Modulator minimum value		
<b>Note:</b>	The selected pulse frequency (p1800) may be reduced if the drive converter has an overload condition (p0290). The following applies for vector drives (p0107): The pulse frequency can also be reduced when changing over the modulator to an optimized pulse pattern. This is used to avoid overcontrol. In the case of chassis power units, two-thirds of the setpoint pulse frequency is displayed in the FLB modulation range.		

<b>p1802[0...n] Modulator mode / Modulator mode</b>			
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Modulation <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> CALC_MOD_LIM_REF <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 9	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the modulator mode.		
<b>Value:</b>	0: Automatic changeover SVM/FLB 1: Flat top modulation (FLB) 2: Space vector modulation (SVM) 3: SVM without overcontrol 4: SVM/FLB without overcontrol 5: SVM with pulse frequency reduction 6: SVM/FLB with pulse frequency reduction 7: No edge modulation up to 100 Hz 8: No edge modulation up to 60 Hz 9: Edge modulation		
<b>Dependency:</b>	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), or if the power unit firmware is not able to calculate edge modulation (r0192.0 = 0), then only space vector modulation without overcontrol can be set as modulation type (p1802 = 3). Refer to: r0192, p0230, p7003		

**Notice:** If the pulse patterns are enabled with overmodulation option (p1802 < 3) or edge modulation (p1802 > 6), then the current actual value correction is automatically activated (p1840.0 = 0).

**Note:** When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 1, 2, 5, 6), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.

When changing p1802[x], the values for all of the other existing indices are also changed.

p1802 = 7, 8 should be used if the drive is operated below 100 Hz or 60 Hz, and it is necessary to avoid changing over to edge modulation. Above these output frequencies, the modulation depth remains limited so that there the full output voltage of the edge modulation is not reached.

<b>p1803[0...n] Maximum modulation depth / Modulat depth max</b>			
VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> CALC_MOD_LIM_REF	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 6723
	<b>P-Group:</b> Modulation	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 20.0 [%]	<b>Max</b> 150.0 [%]	<b>Factory setting</b> 100.0 [%]
<b>Description:</b>	Defines the maximum modulation depth.		
<b>Note:</b>	p1803 = 100% is the overcontrol limit for space vector modulation (for an ideal drive converter without any switching delay). If an optimized pulse pattern is enabled (edge modulation), then the modulation depth is limited to below the output frequency of 28 Hz as there is no optimized pulse pattern in this range.

	12	Pulse freq. can be asynchronously set to curr. ctrl clock cycle	Yes	No
	13	Pulse freq. reduction before optimized pulse patterns for 500 µs	Yes	No
	14	Deactivate maximum angular difference adaptation	Yes	No
Dependency:	If bit 2 is set from 1 to 0, p1811 = 0 is set.			

**Notice:**

Bit 1 = 0 can only be set under a pulse inhibit and for  $r0192.14 = 1$ .

Bit 2 can only be set to 1 subject to the following prerequisites:

- Pulse inhibit
- $r0192.16 = 1$
- $p1800 < 2 \times 1000 / p0115[0]$

Bit 12 can only be changed subject to the following prerequisites:

- preconditions, the same as bit 2 = 1
- $p1810.3 = 0$

**Note:**

Re bit 00 = 0:

Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage).

Re bit 00 = 1:

Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current).

The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0).

Re bit 01 = 0:

DC link voltage compensation in the modulator.

Re bit 01 = 1:

DC link voltage compensation in the current control.

Re bit 02 = 0:

A gating unit that does not permit wobulation is used.

Edge modulation is not possible for a parallel connection with a single-winding system ( $p7003 = 0$ ).

Bit 02 cannot be set to 0 if bit 12 = 1.

Re bit 02 = 1:

A gating unit that permits wobulation is used.

For a wobulation amplitude  $p1811 = 0$ , the maximum possible pulse frequency in  $P1800 = 2 \times 1000 / p0115[0]$ .

For a wobulation amplitude  $p1811 > 0$ , the maximum possible pulse frequency in  $P1800 = 1000 / p0115[0]$ .

If optimized pulse patterns has been activated ( $p1802 > 6$ ), then a parameter save is required and switch-off and switch-on again. This is displayed using a fault message (F01040).

Re bit 03 = 1:

The actual current value sensing and the determination of the valve ON times takes place with a double current controller clock cycle and phase offset.

The activation is only possible with  $r0192.23 = 1$  and  $p1810.12 = 0$  - and takes effect the next time the system is powered up.

Re bit 08 = 1:

Above the frequency threshold  $r1836[0]$ , the pulse frequency is switched to the value in  $p1800$ . Below  $r1836[0]$  (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency (see  $r0114$ ).

Re bit 09 = 1:

Above the frequency threshold  $r1836[1]$ , the pulse frequency is increased to the next possible value. Below  $r1836[1]$  (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency.

If bit 8 is set to 0, bit 9 is automatically reset.

Re bit 10 = 0:

Pulse-locking function activated.

Re bit 10 = 1:

Pulse-dropping function activated.

Re bit 12 = 0:

The pulse frequency  $p1800$  can also be synchronously set to the current controller clock cycle (see  $r0114$ ).

Bit 12 can only be set from 1 to 0 if the pulse frequency  $p1800$  is set synchronously to the current controller clock cycle. In this case, the gating unit is not switched over.

Re bit 12 = 1:

The pulse frequency  $p1800$  can also be asynchronously set to the current controller clock cycle. In this case, the effects should be observed (see  $p1800$ ).

If bit 12 is set to 1, then the gating unit is automatically switched over ( $p1810.2 = 1$ ). If this is not possible (see above), then bit 12 cannot be set to 1.

Bit 12 cannot be set to 1, if  $p1810.3 = 1$  is set.

<b>Dependency:</b>	Refer to: p1818, p1819			
<b>Note:</b>	A change only becomes effective after booting. If one of the following secondary conditions is not fulfilled, then none of the power units from the subgroup are clocked with an offset. Secondary conditions for clocking with an offset: - the PWM frequency (p1800[D]) of all power units in the subgroup must be the same. - the PWM frequency (p1800[D]) must be the same in all drive data sets in the subgroup. - the following must apply for the ratio between the PWM cycle (1/p1800[D]) and the current controller cycle (p0115[0]): The ratio (1/p1800[D]) / (p0115[0]) must be an even integer number (2, 4, 6, ...) for all power units in the subgroup. or The ratio (p0115[0]) / (1/p1800[D]) must be an integer number (1, 2, 3, ...) for all power units in the subgroup.			

**p1816 Set phase for PWM generation manually / Set Ph for PWM**

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Modulation	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-1	16	-1

**Description:** Sets manual setting and overwriting of automatically determined phase shift for "offset clocking".

For p1816 = -1, the following applies:

Automatic mode. The phase shift value is automatically determined.

For p1816 = 0 ... 16, the following applies:

Manual mode. The user should define the phase shift value as follows:

1. PWM cycle (1/p1800) > current controller clock cycle (p0115[0])

The power unit executes a phase shift from Tshift = current controller cycle (p0115[0]) \* p1816.

2. PWM cycle (1/p1800) <= current controller clock cycle (p0115[0])

For p1816 >= 1, the power unit executes a phase shift from Tshift = PWM cycle/2.

**Dependency:** Refer to: r0116, p1800, p1819

**p1817 Minimum ratio, pulse frequency to the output frequency / Min f\_puls / f\_max**

VECTOR_G	<b>Can be changed:</b> C2(2)	<b>Calculated:</b> -	<b>Access level:</b> 4
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Converter	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	8.3	15.0	12.0

**Description:** Sets the minimum ratio between the pulse frequency and the output frequency.

**Notice:** If the ratio between the pulse frequency and the output frequency is reduced, then oscillations can occur in the output current that can result in significant levels of current ripple with the appropriate negative effects.

**Note:** When the maximum speed is changed, the pulse frequency p1800 is automatically limited to this minimum ratio. It is not permissible to reduce the pulse frequency if this would result in this ratio being undershot.

**p1818 Phase for PWM generation configuration / Ph for PWM config**

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Modulation	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	1

**Description:** Sets the phase shift for offset clocking.

For the first active power unit, it is specified whether clocking is to start at 0° (value = 0) or 180° (value = 1). All other active power units are clocked alternately according to the setting made here.

**Dependency:** Refer to: p1819

**Note:** A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

<b>p1819</b>	<b>Phase for PWM generation / Ph for PWM</b>		
VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Modulation <b>Not for motor type:</b> - <b>Min</b> -1	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 16	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -1
<b>Description:</b>	<p>Display for "offset clocking".</p> <p>Depending on the particular case, the value is interpreted differently:</p> <p>Case 1:</p> <p>The PWM clock cycle (1/p1800[D]) is greater than the current controller clock cycle (p115[0]) and the ratio between the PWM clock cycle and the current controller clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 4 kHz, 2 kHz, 1 kHz).</p> <p>The value displayed refers to:</p> <ul style="list-style-type: none"> <li>- the phase shift in the current-controller cycles to be applied by the power unit.</li> </ul> <p>Case 2:</p> <p>The PWM clock cycle (1/p1800[D]) is less than or equal to the current controller clock cycle (p0115[0]) and the ratio between the current controller clock cycle and the PWM clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 8 kHz, 16 kHz).</p> <p>The value 1 displayed means that:</p> <ul style="list-style-type: none"> <li>- the power unit is to apply a phase shift of 180 ° (from the PWM cycle).</li> </ul> <p>A value of 0 displayed on all power units of the drive line-up means the following:</p> <ul style="list-style-type: none"> <li>- the general conditions of the "offset clocking" (see p1815) are not fulfilled, i.e. no power unit is clocked with an off-set.</li> </ul>		
<b>Dependency:</b>	Refer to: p0108, r0108, p0115, p1800, p1815, p1816, p1818		
<b>Note:</b>	For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a display parameter. This means that factory setting -1 no longer has any significance and is only available for reasons of compatibility.		
<b>p1820[0...n]</b>	<b>Reverse the output phase sequence / Outp_ph_seq rev</b>		
VECTOR_G	<b>Can be changed:</b> C2(3) <b>Data type:</b> Integer16 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> 6732 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	<p>Sets the phase sequence reversal for the motor.</p> <p>If the motor does not rotate in the required direction, then the output phase sequence can be reversed using this parameter. This means that with the same setpoint, the motor direction is reversed without reversing the encoder actual value.</p> <p>When a speed encoder is being used, it may be necessary to also invert the encoder actual value (p0410).</p>		
<b>Value:</b>	0: OFF 1: ON		
<b>Dependency:</b>	Refer to: p1821		
<b>Caution:</b>	For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.		
			
<b>Caution:</b>	Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.		
<b>Note:</b>	<p>This setting can only be changed when the pulses are inhibited.</p> <p>p1821 can be used to reverse the phase sequence and encoder actual value.</p>		

<b>p1821[0...n]</b>	<b>Dir of rot / Dir of rot</b>		
VECTOR_G	<b>Can be changed:</b> C2(3) <b>Data type:</b> Integer16  <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0 <b>Max</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180  <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> 4704, 4710, 4711, 4715, 5730, 6730, 6731, 6732 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
<b>Value:</b>	0: CW 1: CCW		
<b>Dependency:</b>	Refer to: F07434		
<b>Danger:</b>	 When using external speed actual values for the speed controller (see p1440), for a direction of rotation change (p1821 = 1), then its polarity must also be changed (e.g. for drive object ENCODER via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.		
<b>Caution:</b>	 For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.		
<b>Caution:</b>	Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.		
<b>Notice:</b>	An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.		
<b>Note:</b>	For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft.  When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).  p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.		
<b>p1825</b>	<b>Converter valve threshold voltage / Threshold voltage</b>

<b>p1900</b>	<b>Motor data identification and rotating measurement / MotID and rot meas</b>		
VECTOR_G	<b>Can be changed:</b> C2(1), T	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Motor identification	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0	<b>Max</b> 2	<b>Factory setting</b> 2
<b>Description:</b>	Sets the motor data identification and speed controller optimization. p1900 = 0: Function inhibited. p1900 = 2: Induction motors --> set p1910 = 1 and p1960 = 0 Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0		

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.

**Value:** 0: Inhibited  
2: Identify motor data at standstill

**Dependency:** In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1272, p1300, p1910

Refer to: F07990, A07991

**Notice:** If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

It is not permissible to activate write protection during the motor identification (p7761).

**Note:** The motor and control parameters are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating).

An appropriate alarm is output when the parameter is set.

The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

---

## **p1900 Motor data identification and rotating measurement / MotID and rot meas**

<b>VECTOR_G (n/M)</b>	<b>Can be changed:</b> C2(1), T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 2
-----------------------	---	--	---

**Description:** Sets the motor data identification and speed controller optimization.

The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960).

p1900 = 0:  
Function inhibited.

p1900 = 1:  
Induction motors --> set p1910 = 1 and p1960 = 0, 1, 2 depending on p1300  
Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0, 1, 2 depending on p1300

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.

With the following power-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.

p1900 = 2:  
Induction motors --> set p1910 = 1 and p1960 = 0  
Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.

p1900 = 3:

Sets p1960 = 0, 1, 2 depending on p1300

This setting should only be selected if the motor data identification was already carried out at standstill.

When the drive enable signals are present, with the next power-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

**Value:**

0:	Inhibited
1:	Identify motor data at standstill and with motor rotating
2:	Identify motor data at standstill
3:	Identify motor data with motor rotating

**Dependency:** In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1272, p1300, p1910, p1960, p1990

Refer to: A07980, A07981, F07982, F07983, F07984, F07985, F07986, A07987, F07988, F07990, A07991

**Notice:** If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

It is not permissible to activate write protection during the motor identification (p7761).

p1900 = 3:

This setting should only be selected if the motor data identification was already carried out at standstill.

**Note:** The motor and control parameters are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating).

An appropriate alarm is output when the parameter is set.

The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

Description:		Sets the configuration for the test pulse evaluation. Bit 00: Check for conductor-to-conductor short circuit once/always when the pulses are enabled. Bit 01: Check for ground fault once/always when the pulses are enabled. Bit 02: Activation of the tests selected using bit 00 and/or bit 01 each time the pulses are enabled				
Bit field:		Bit	Signal name	1 signal	0 signal	FP
		00	Phase short-circuit test pulse active	Yes	No	-
		01	Ground fault detection test pulse active	Yes	No	-
		02	Test pulse at each pulse enable	Yes	No	-
Dependency:		Refer to: p0287				
Note:		Re bit 02=0: If the test was successful once after POWER ON (see r1902.0), it is not repeated. Re bit 02=1: The test is not only performed after POWER ON, but also each time the pulses are enabled. If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1. If a ground fault is detected during the test, this is displayed in r1902.2.				

<b>r1902</b>	<b>Test pulse evaluation status / Test puls ev stat</b>																																	
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Unsigned32 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -																															
<b>Description:</b>	Displays the status of the test pulse evaluation. Short-circuit test: Bit 0: The short-circuit test was executed without any fault. Bit 1: A phase short circuit has been detected. Bit 2: A ground fault test was successfully performed. Bit 3: A ground fault was detected. Bit 4: A test pulse longer than one sampling time has occurred

<b>Note:</b>	If the ground fault test was selected, but not successfully performed, then sufficient current will not be able to be established during the test pulse.																																	
<b>p1905</b>	<b>Parameter tuning selection / Par tune select</b>																																	
VECTOR_G (n/M)	<b>Can be changed:</b> C2(1), T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 90	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0																															
<b>Description:</b>	The fine encoder calibration (TUNE_ENC_FINE) should be started during the first commissioning or after the encoder is replaced. The fine calibration starts when the pulses are enabled and performs a rotating measurement (approximately 1 minute). In this case, a setpoint speed of at least 40 % of the motor rated speed must be entered, and the torque must be less than half of the motor rated torque. The phases of the fine calibration of displayed using alarm A07976. The fine calibration ends with the calculation of p0431 for the following pulse inhibit. p1905 is automatically set to 0 at the end of the fine calibration.																																	
<b>Value:</b>	0: Inactive 90: Encoder fine tuning																																	
<b>Dependency:</b>	If the motor encoder adjustment has not been performed (p3925, bit 4 = 0) or the encoder calibration is activated (p1990 != 0), then encoder fine calibration is prevented. Refer to: p1272, p1910, p1960, p1990 Refer to: A07976																																	
<b>Caution:</b>	During encoder fine calibration, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.																																	
<b>Notice:</b>	For p1905 = 90 and with the pulses not enabled, the function is only executed the next time that the pulses are enabled. When selecting the encoder fine calibration, the changeover of the motor data sets is suppressed.																																	

<b>p1909[0...n]</b>	<b>Motor data identification control word / MotID STW</b>			
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Unsigned32 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0000 0000 0000 0000 0000 0000 0000 0000 bin	
<b>Description:</b>	Sets the configuration for the motor data identification.			
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>
	00	Stator inductance estimate no measurement	Yes	No
	01	Cl.-loop current control w/ dead-beat controller	Yes	No
	02	Rotor time constant estimate no measurement	Yes	No
	03	Leakage inductance estimate no measurement	Yes	No
	04	Activates the identification dynamic leakage inductance	Yes	No
	05	Determine Tr and Lsig evaluation in the time range	Yes	No
	06	Activate vibration damping	Yes	No
	07	De-activate vibration detection	Yes	No
	11	De-activate pulse measurement Lq Ld	Yes	No
	12	De-activate rotor resistance Rr measurement	Yes	No
	14	De-activate valve interlocking time measurement	Yes	No
	15	Determine only stator resistance, valve voltage fault, dead time	Yes	No
	16	Short motor identification (lower quality)	Yes	No
<b>Note:</b>	The following applies to permanent-magnet synchronous motors: Without de-selection in bit 11, in the closed-loop control mode, the direct inductance LD and the quadrature inductance Lq are measured at a low current. When de-selecting with bit 11 or in the U/f mode, the stator inductance is measured at half the rated motor current. If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be de-selected.			
<b>p1910</b>	<b>Motor data identification selection / MotID selection</b>			
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 26	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1	
<b>Description:</b>	Sets the motor data identification routine. The motor data identification routine is carried out after the next power-on command. p1910 = 1: All motor data and the drive converter characteristics are identified and then transferred to the following parameters: p0350, p0354, p0356, p0357, p0358, p0360, p1825, p1828, p1829, p1830 After this, the control parameter p0340 = 3 is automatically calculated.			
<b>Value:</b>	0: Inhibited 1: Complete identification (ID) and acceptance of motor data 2: Complete identification (ID) of motor data without acceptance			

- 3: ID of the saturation characteristic and acceptance
- 4: ID of the saturation characteristic without acceptance
- 5: ID of dynamic leakage inductance Lsig (r1920) without acceptance
- 6: ID of lockout time (r1926) without acceptance
- 7: ID of stator resistance Rs (r1912) without acceptance
- 8: ID of stator inductance Ls (r1915) Rr (r1927) without acceptance
- 9: ID of rotor time constant Tr (r1913) without acceptance
- 10: ID of static leakage inductance Lsig (r1914) without acceptance
- 20: Voltage vector input
- 21: Voltage vector input without filter
- 22: Rectangular voltage vector input without filter
- 23: Triangular voltage vector input without filter
- 24: Rectangular voltage vector input with filter
- 25: Triangular voltage vector input with filter
- 26: Enter voltage vector with DTC correction

- Dependency:** "Quick commissioning" must be carried out (p0010 = 1) before executing the motor data identification routine!  
In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.  
Refer to: p1272, p1900
- Caution:** After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next power-on command:  
- current flows through the motor and a voltage is present at the drive converter output terminals.  
- during the identification routine, the motor shaft can rotate through a maximum of half a revolution.  
- however, no torque is generated.
- Notice:** If there is a motor holding brake, it must be open (p1215 = 2).  
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).
- Note:** When setting p1910, the following should be observed:  
1. "With acceptance" means:  
The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.  
2. "Without acceptance" means:  
The identified parameters are only displayed in the range r1912 ... r1926. The controller settings remain unchanged.  
3. p1910 = 3, 4, 5 can only be selected for induction motors.

	-	-	0000 0000 0001 1111 bin		
<b>Description:</b>	Sets the configuration of the rotating measurement.				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Enc test active	Yes	No	-
	01	Saturation characteristic identification	Yes	No	-
	02	Moment of inertia identification	Yes	No	-
	03	Re-calculates the speed controller parameters	Yes	No	-
	04	Speed controller optimization (vibration test)	Yes	No	-
	05	q leakage inductance ident. (for current controller adaptation)	Yes	No	-
	12	Measurement shortened	Yes	No	-
<b>Dependency:</b>	Refer to: F07988				
<b>Note:</b>	The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2). The following parameters are influenced for the individual optimization steps: Bit 00: None Bit 01: p0320, p0360, p0362 ... p0369 Bit 02: p0341, p0342 Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496 Bit 04: Dependent on p1960 Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors p1960 = 1, 3: p1400.0, p1458, p1459, p1470, p1472, p1496				

p1960 = 2, 4: p1458, p1459, p1460, p1461, p1462, p1463, p1496

The identification of the q leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the q-leakage inductance under no-load conditions is at least 30 % higher than the total leakage inductance (p0356, p0358).

Re bit 12 = 1:

The selection only has an effect on the measurement p1960 = 1, 2. For the shortened measurement, the magnetizing current and moment of inertia are determined with a somewhat lower accuracy.

p1960 Rotating measurement selection / Rot meas sel			
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> REL <b>Min</b> 0 <b>Max</b> 4	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Factory setting</b> 0	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1
<b>Description:</b>	Sets the rotating measurement. The rotating measurement is carried out after the next power-on command. The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300). p1300 < 20 (U/f open-loop control): It is not possible to select rotating measurement or speed controller optimization. p1300 = 20, 22 (encoderless operation): Only rotating measurement or speed controller optimization can be selected in the encoderless mode. p1300 = 21, 23 (operation with encoder): Both versions (encoderless and with encoder) of the rotating measurement and speed controller optimization can be selected.		
<b>Value:</b>	0: Inhibited 1: Rotating measurement in encoderless operation 2: Rotating measurement with encoder 3: Speed controller optimization in encoderless operation 4: Speed controller optimization with encoder		
<b>Dependency:</b>	Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done. In the simulation mode, a value of 1 cannot be written into the parameter. When selecting the rotating measurement, the drive data set changeover is suppressed. Refer to: p1272, p1300, p1900, p1959 Refer to: A07987		
<b>Danger:</b>	For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.		
			
<b>Notice:</b>	If there is a motor holding brake, it must be open (p1215 = 2).		
<b>Note:</b>	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). When the rotating measurement is activated, it is not possible to save the parameters (p0971, p0977). Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made. The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s. For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472). Depending on whether the speed controller optimization is carried out with or without encoder, different Kp/Tn adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.		

<b>p1961</b>	<b>Saturation characteristic speed to determine / Sat_char n determ</b>

**p1980[0...n] PolID technique / PolID technique**

VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> -
	<b>P-Group:</b> Motor identification	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> ASM	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	1	10	4

**Description:** Sets the pole position identification technique.

<b>Value:</b>	1: Voltage pulsing 1st harmonics 4: Voltage pulsing 2-stage 6: Voltage pulsing 2-stage inverse 10: DC current injection
<b>Dependency:</b>	In the simulation mode, the parameter cannot be written into. Refer to: p1272, p1780
<b>Note:</b>	Voltage pulse technique (p1980 = 1, 4, 6) cannot be applied to separately-excited synchronous motors (p0300 = 5) and for operation with sine-wave output filters (p0230).

<b>p1982[0...n]</b>	<b>PolID selection / PolID selection</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> MDS, p0130 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Activates the pole position identification routine to determine the commutation angle and to carry out a plausibility check.		
<b>Value:</b>	0: Pole position identification off 1: Pole position identification for commutation 2: Pole position identification for plausibility check		
<b>Recommend.:</b>	Re p1982 = 1: This is used for synchronous motors with motor encoder without absolute data. The information/data regarding the absolute commutation angle is supplied via a track C/D, Hall sensors, an absolute encoder or from the pole position identification routine. Re p1982 = 2: This is used for synchronous motor with motor encoder with absolute data to check this data. For VECTOR, the following applies: With p1982 = 2, each time the pulses are enabled it is checked whether the absolute position supplied from the encoder does not exceed a deviation of 45 degrees to the identified pole wheel position. With separately-excited synchronous motors (p0300 = 5), pole position identification cannot be selected if an encoder with position data is used (e.g. SSI encoder).		
<b>Dependency:</b>	Refer to: p0325, p0329, p1980, r1984, r1985, r1987, p1990		
<b>Note:</b>	For encoderless operation, the pole position identification routine is selected with p1780.6		

<b>r1984</b>	<b>PolID angular difference / PolID ang diff</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> - [°]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [°]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [°]
<b>Description:</b>	Displays the angular difference between the actual electrical commutation angle and the angle determined by the pole position identification.		
<b>Dependency:</b>	Refer to: p0325, p0329, p1980, p1982, r1985, r1987, p1990		
<b>Note:</b>	PolID: Pole position identification When the pole position identification routine is executed several times using p1983, the spread of the measured values can be determined using this value. At the same position, the spread should be less than 2 degrees electrical.		

<b>r1985</b>	<b>PolID saturation curve / PolID sat_char</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> - [Arms]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [Arms]
<b>Description:</b>	Displays the saturation characteristic of the pole position identification routine (saturation technique). Displays the current characteristic of the pole position identification routine (elasticity technique).		
<b>Dependency:</b>	Refer to: p0325, p0329, p1980, p1982, r1984, r1987, p1990		
<b>Note:</b>	PolID: Pole position identification Regarding the saturation technique: The values for the characteristic of the last saturation-based pole position identification routine are output every 1 ms in order to record signals (e.g. trace).		
<b>r1987</b>	<b>PolID trigger characteristic / PolID trig_char</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> - <b>Min</b> - [%]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> - [%]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> - [%]
<b>Description:</b>	Displays the trigger characteristic of the pole position identification routine. The values for the characteristic of the last pole position identification routine are output every 1 ms in order to record signals (e.g. trace). The values for trigger characteristic and saturation characteristic are always output in synchronism from a time perspective.		
<b>Dependency:</b>	Refer to: p0325, p0329, p1980, p1982, r1984, r1985, p1990		
<b>Note:</b>	PolID: Pole position identification The following information and data can be taken from the trigger characteristic. - the value -100% marks the angle at the start of the measurement. - the value +100 % marks the commutation angle determined from the pole position identification routine.		
<b>p1990</b>	<b>Encoder adjustment, determine angular commutation offset / Enc_adj det ang</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Motor identification <b>Not for motor type:</b> ASM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder. The function acts on the active motor data set. Alarm A07971 is output while the angular commutation offset is being determined. p1990 is automatically set to 0 after the angular commutation offset has been determined. For p1990 = 1 (encoder adjustment with transfer), the following applies: The angular commutation offset is determined and transferred into p0431. For p1990 = 2 (encoder adjustment for checking), the following applies: The angular commutation offset is determined and is not transferred into p0431. For a deviation of more than 6 ° electrical, fault F07413 is output. For p1990 = 3 (encoder adjustment in operation), the following applies: PolID procedure runs before the zero mark detection. The angular commutation offset is determined and transferred into p0431. A fine adjustment (p1905) is then optionally possible.		

**Value:**

- 0: De-activated
- 1: Activated with transfer
- 2: Activated for checking
- 3: Activates encoder adjustment in operation

**Dependency:** In the simulation mode, the parameter cannot be written into.  
 When selecting the encoder adjustment, the changeover of the drive data sets is suppressed.  
 Encoder adjustment is only carried out if the function module for "speed/torque control" is activated (r0108.2 = 1).  
 Refer to: p0325, p0329, p0431, p1272, p1900

**Caution:** When the encoder is being adjusted, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.

---

### p1991[0...n] Motor changeover, angular commutation correction / Ang\_com corr

<b>VECTOR_G</b>	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-180 [°]	180 [°]	0 [°]

**Description:** Sets the angle that is added to the commutating angle.

**Caution:** If the angular correction is not correctly set, when changing over and with closed-loop torque control, the motor can accelerate to high speeds in spite of the fact that a setpoint of zero has been entered.

---

### p1999[0...n] Ang. commutation offset calibr. and PolID scaling / Com\_ang\_offs scal

<b>VECTOR_G (n/M)</b>	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> MDS, p0130	<b>Func. diagram:</b> -
	<b>P-Group:</b> Closed-loop control	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	10 [%]	5000 [%]	100 [%]

**Description:** Sets the scaling for the runtime of the automatic encoder calibration and of the pole position identification technique in which the current is injected.

**Dependency:** Refer to: p0341, p0342

**Caution:** For p1999 > 100 % (setting large moments of inertia) the following applies:

There is no locked rotor monitoring (F07970 fault value 2).

The plausibility check of the encoder signal (F07970 fault value 4) only checks the sign.

**Note:** For high moments of inertia, it is practical to scale the runtime of the calibration higher.

---

### p2000 Reference frequency / f\_ref

<b>B_INF</b>	<b>Can be changed:</b> T	<b>Calculated:</b> CALC_MOD_ALL	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.10 [Hz]	1000.00 [Hz]	50.00 [Hz]

**Description:** Sets the reference quantity for the frequency.

All frequencies specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

The following applies: Reference frequency (in Hz)

<b>p2000</b>	<b>Reference speed reference frequency / n_ref f_ref</b>		
ENC	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 6.00 [rpm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 3000.00 [rpm]
<b>Description:</b>	Sets the reference quantity for speed and frequency. All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Note:</b>	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.		
<b>p2000</b>	<b>Reference velocity, reference frequency / v_ref f_ref</b>		
ENC (Lin_enc)	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0.60 [m/min]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 600.00 [m/min]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 120.00 [m/min]
<b>Description:</b>	Sets the reference quantity for velocity and frequency. All velocities or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference velocity (in (m/min) / 60)		
<b>Note:</b>	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.		
<b>p2000</b>	<b>Reference speed reference frequency / n_ref f_ref</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 6.00 [rpm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 210000.00 [rpm]	<b>Access level:</b> 2 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 3000.00 [rpm]
<b>Description:</b>	Sets the reference quantity for speed and frequency. All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number)		
<b>Dependency:</b>	Refer to: p2001, p2002, p2003, r2004		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000). Example 2: The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).		

<b>p2001</b>	<b>Reference voltage / Reference voltage</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 10 [Vrms]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100000 [Vrms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1000 [Vrms]
<b>Description:</b>	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). Note: This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.		

---

<b>p2002</b>	<b>Reference current / I_ref</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0.10 [Arms]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 100000.00 [Arms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 100.00 [Arms]
<b>Description:</b>	Sets the reference quantity for currents. All currents specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Notice:</b>	If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records). Example: p2002 = 100 A Reference quantity 100 A corresponds to 100 % p0305[0] = 100 A Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current p0305[1] = 50 A Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity. Example: The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.		

<b>p2003</b>	<b>Reference torque / M_ref</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0.01 [Nm]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> 7_2 <b>Scaling:</b> - <b>Max</b> 20000000.00 [Nm]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> 1.00 [Nm]
<b>Description:</b>	Sets the reference quantity for torque. All torques specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example: The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.		
<b>r2004</b>	<b>Reference power / P_ref</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> - [kW]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> 14_10 <b>Scaling:</b> - <b>Max</b> - [kW]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> p0505 <b>Expert list:</b> 1 <b>Factory setting</b> - [kW]
<b>Description:</b>	Displays the reference quantity for power. All power ratings specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Dependency:</b>	This value is calculated as follows: Infeed: Calculated from voltage times current. Closed-loop control: Calculated from torque times speed. Refer to: p2000, p2001, p2002, p2003		
<b>Note:</b>	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. The reference power is calculated as follows: - $2 \cdot \pi \cdot \text{reference speed} / 60 \cdot \text{reference torque (motor)}$ - $\text{reference voltage} \cdot \text{reference current} \cdot \text{root}(3)$ (infeed)		
<b>p2005</b>	<b>Reference angle / Reference angle</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 90.00 [°]	<b>Calculated:</b> CALC_MOD_ALL <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 180.00 [°]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 90.00 [°]
<b>Description:</b>	Sets the reference quantity for angle. All angles specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.		

<b>p2006</b>	<b>Reference temp / Ref temp</b>

### p2035 Fieldbus interface USS PIV drive object number / Fieldbus USS DO\_no

CU_G130_DP, CU_G150_DP	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	1	62	2

**Description:** Sets the drive object number for communication via the field bus interface (USS).

**Dependency:** Refer to: p0978

**Note:** p2035 defines the destination for USS parameter requests (PIV).  
p0978[0] defines the destination for USS process data (PZD).  
The parameter is available globally on all drive objects.  
The parameter is not influenced by setting the factory setting.

<b>p2037</b>	<b>IF1 PROFIdrive STW1.10 = 0 mode / IF1 PD STW1.10=0</b>		
B_INF, ENC, VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.		
<b>Value:</b>	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints		
<b>Recommend.:</b>	Do not change the setting p2037 = 0.		
<b>Note:</b>	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.		
<b>p2038</b>	<b>IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the interface mode of the PROFIdrive control words and status words. When selecting a telegram via p0922 (p2079), this parameter influences the device-specific assignment of the bits in the control and status words.		
<b>Value:</b>	0: SINAMICS 1: SIMODRIVE 611 universal 2: VIK-NAMUR		
<b>Dependency:</b>	Refer to: p0922, p2079		
<b>Notice:</b>	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<b>Note:</b>	For p0922 (p2079) = 100 ... 199, p2038 is automatically set to 1 and p2038 can no longer be changed. This means that for these telegrams, the "SIMODRIVE 611 universal" interface mode is set and cannot be changed.		
<b>p2039</b>	<b>Select debug monitor interface / Debug monit select</b>

	<b>Min</b> 0	<b>Max</b> 1	<b>Factory setting</b> 0	
<b>Description:</b>	Sets the PROFIBUS Ident Number (PNO-ID). SINAMICS can be operated with various identities on PROFIBUS. This allows the use of a PROFIBUS GSD that is independent of the device (e.g. PROFIdrive VIK-NAMUR with Ident Number 3AA0 hex).			
<b>Value:</b>	0: SINAMICS 1: VIK-NAMUR			
<b>Note:</b>	Every change only becomes effective after a POWER ON.			
<b>r2043.0...2</b>	<b>BO: IF1 PROFIdrive PZD state / IF1 PD PZD state</b>			
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3	
	<b>Data type:</b> Unsigned8	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2410	
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -	
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> -	
<b>Description:</b>	Displays the PROFIdrive PZD state.			
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>
	00	Setpoint failure	Yes	No
	01	Clock cycle synchronous operation active	Yes	No
	02	Fieldbus oper	Yes	No
<b>Dependency:</b>	Refer to: p2044			
<b>Note:</b>	When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.			
<b>p2044</b>	<b>IF1 PROFIdrive fault delay / IF1 PD fault delay</b>			
B_INF, ENC, VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3	
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2410	
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -	
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b> 0 [s]	<b>Max</b> 100 [s]	<b>Factory setting</b> 0 [s]	
<b>Description:</b>	Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that is is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).			

**Dependency:** Refer to: r2043  
Refer to: F01910

<b>p2045</b>	<b>CI: PB/PN clock synchronous controller sign-of-life signal source / PB/PN ctrSoL S_src</b>		
ENC, VECTOR_G (n/M)	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32 / Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2410
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0

**Description:** Connector input for the sign-of-life of the clock synchronous PROFIBUS/PROFINET controller.  
The sign-of-life is expected at bits 12 to 15. Bits 0 to 11 are not evaluated.  
The sign-of-life signal is normally received in PZD4 (control word 2) from the controller.

**Dependency:** Refer to: p0925, r2065

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

<b>p2047</b>	<b>PROFIBUS additional monitoring time / PB suppl t_monit</b>		
CU_G130_DP, CU_G150_DP	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2410
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0 [ms]	20000 [ms]	0 [ms]

**Description:** Sets the additional monitoring time to monitor the process data received via PROFIBUS.  
The additional monitoring time enables short bus faults to be compensated.  
If no process data is received within this time, an appropriate message is output.

**Recommend.:** Do not set the additional monitoring time for clock-synchronous operation.

**Dependency:** Refer to: F01910

**Note:** For controller STOP, the additional monitoring time is not effective.

<b>p2048</b>	<b>IF1 PROFIdrive PZD sampling time / IF1 PZD t_sample</b>		
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> C1(3)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	1.00 [ms]	16.00 [ms]	4.00 [ms]

**Description:** Sets the sampling time for the cyclic interface 1 (IF1).

**Note:** The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set.

For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).

### r2054 PROFIBUS status / PB status

CU_G130_DP, CU_G150_DP	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 2410
	<b>P-Group:</b> Communications	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	4	-

**Description:** Status display for the PROFIBUS interface.

**Value:**

- 0: OFF
- 1: No connection (search for baud rate)
- 2: Connection OK (baud rate found)
- 3: Cyclic connection with master (data exchange)
- 4: Cyclic data OK

**Note:** Re r2054 = 3:

In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation:

- No setpoints are being received as the PROFIBUS master is in the STOP condition.

Only for clock-cycle synchronous operation, the following applies:

- The drive is not in synchronism as the global control (GC) has an error.

Re r2054 = 4:

In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free.

This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.

<b>p2079</b>	<b>IF1 PROFIdrive PZD telegram selection extended / IF1 PD PZD tel ext</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 999	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 999
<b>Description:</b>	Sets the send and receive telegram. Contrary to p0922, a telegram can be selected using p2079 and subsequently expanded. For p0922 < 999 the following applies: p2079 has the same value and is inhibited. All of the interconnections and extensions contained in the telegram are inhibited. For p0922 = 999 the following applies: p2079 can be freely set. If p2079 is also set to 999, then all of the interconnections can be set. For p0922 = 999 and p2079 < 999 the following applies: The interconnections contained in the telegram are inhibited. However, the telegram can be extended.		
<b>Value:</b>	1: Standard telegram 1, PZD-2/2 2: Standard telegram 2, PZD-4/4 3: Standard telegram 3, PZD-5/9 4: Standard telegram 4, PZD-6/14 20: Standard telegram 20, PZD-2/6 220: SIEMENS telegram 220, PZD-10/10 352: SIEMENS telegram 352, PZD-6/6 999: Free telegram configuration with BICO

B_INF, CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN, ENC, TB30, TM150, TM31, VECTOR_G	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 / Integer16 <b>P-Group:</b> Communications <b>Not for motor type:</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> 2468 <b>Unit selection:</b> - <b>Expert list:</b> 1
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> 0
<b>Description:</b>	Sets the signal source for the connector-binector converter. A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection).		
<b>Dependency:</b>	Refer to: r2094, r2095		
<b>Note:</b>	From the signal source set via the connector input, the corresponding lower 16 bits are converted. p2099[0...1] together with r2094.0...15 and r2095.0...15 forms two connector-binector converters: Connector input p2099[0] to binector output in r2094.0...15 Connector input p2099[1] to binector output in r2095.0...15

**Expert list:** 1

**Min**  
0

**Max**  
7

**Factory setting**  
0

**Description:** Sets the fault response for the selected fault.

**Value:** 0: NONE  
1: OFF1  
2: OFF2  
3: OFF3  
4: STOP1 (being developed)  
5: STOP2  
6: Internal armature short-circuit / DC braking  
7: ENCODER (p0491)

**Dependency:** The fault is selected and the required response is set under the same index.  
Refer to: p2100

**Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.  
The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms").

Example:

F12345 and fault response = OFF3 (OFF1, OFF2, NONE)

--> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE.

Re value = 1 (OFF1):

Braking along the ramp-function generator down ramp followed by a pulse inhibit.

Re value = 2 (OFF2):

Internal/external pulse inhibit.

Re value = 3 (OFF3):

Braking along the OFF3 down ramp followed by a pulse inhibit.

Re value = 5 (STOP2):

n\_set = 0

Re value = 6 (armature short-circuit, internal/DC braking):

The value can only be set for all motor data sets when p1231 = 3, 4.

a) For synchronous motors (p0300 = 2xx, 4xx), an internal armature short-circuit is executed.

b) For induction motors (p0300 = 1xx), a DC braking is initiated.

Re value = 7 (ENCODER (p0491)):

The fault response set in p0491 is executed if applicable.

Note:

IASC: Internal Armature Short Circuit

DCBRK: DC braking

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	1
<b>Description:</b>	Sets the signal source for external alarm 3.		
<b>Dependency:</b>	Refer to: A07852		
<b>Note:</b>	An external alarm is triggered with a 1/0 signal.		

<b>p2118[0...19]</b>	<b>Sets the message number for message type. / Msg_no Msg_type</b>		
All objects	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Messages <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> 1750, 8075 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Selects faults or alarms for which the message type should be changed.		
<b>Dependency:</b>	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2119		
<b>Notice:</b>	It is not possible to re-parameterize the message type in the following cases: - if there is no existing message number.		
<b>Note:</b>	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone.		
<b>p2119[0...19]</b>	<b>Setting the message type / Message type</b>		
All objects	<b>Can be changed:</b> U, T <b>Data type:</b> Integer16 <b>P-Group:</b> Messages <b>Not for motor type:</b> - <b>Min</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 3	<b>Access level:</b> 3 <b>Func. diagram:</b> 1750, 8075 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the message type for the selected fault or alarm.		
<b>Value:</b>	1: Fault (F) 2: Alarm (A) 3: No message (N)		
<b>Dependency:</b>	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2118		
<b>Note:</b>	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone. The message type can only be changed for messages with the appropriate identification. Example: F12345(A) --> Fault F12345 can be changed to alarm A12345. In this case, the message number that may be possibly entered in p2100[0...19] and p2126[0...19] is automatically removed.		
<b>r2120</b>	<b>CO: Sum of fault and alarm buffer changes / Sum buffer changed</b>		
All objects	<b>Can be changed:</b> - <b>Data type:</b> Unsigned16 <b>P-Group:</b> Messages <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 4 <b>Func. diagram:</b> 8065 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the sum of all of the fault and alarm buffer changes in the drive unit.		
<b>Dependency:</b>	Refer to: r0944, r2121		

**r2121 CO: Counter, alarm buffer changes / Alrm buff changed**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 8065
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** This counter is incremented every time the alarm buffer changes.

**Dependency:** Refer to: r2110, r2122, r2123, r2124, r2125

**r2122[0...63] Alarm code / Alarm code**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8065
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the number of alarms that have occurred.

**Dependency:** Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123

**Notice:** The properties of the alarm buffer should be taken from the corresponding product documentation.

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

Alarm buffer structure (general principle):

r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest)

...

r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest)

When the alarm buffer is full, the alarms that have gone are entered into the alarm history:

r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest)

...

r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

**r2123[0...63] Alarm time received in milliseconds / t\_alarm rcv ms**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8065
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [ms]	- [ms]	- [ms]

**Description:** Displays the system runtime in milliseconds when the alarm occurred.

**Dependency:** Refer to: r2110, r2114, r2122, r2124, r2125, r2134, r2145, r2146, r3121, r3123

**Notice:** The time comprises r2145 (days) and r2123 (milliseconds).

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the alarm buffer and the assignment of the indices is shown in r2122.

**r2124[0...63] Alarm value / Alarm value**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8065
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays additional information about the active alarm (as integer number).

**Dependency:** Refer to: r2110, r2122, r2123, r2125, r2134, r2145, r2146, r3121, r3123  
**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).  
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

---

**r2125[0...63] Alarm time removed in milliseconds / t\_alarm res ms**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8065
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [ms]	- [ms]	- [ms]

**Description:** Displays the system runtime in milliseconds when the alarm was cleared.

**Dependency:** Refer to: r2110, r2114, r2122, r2123, r2124, r2134, r2145, r2146, r3121, r3123

**Notice:** The time comprises r2146 (days) and r2125 (milliseconds).

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).  
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

---

**p2126[0...19] Setting fault number for acknowledge mode / Fault\_no ackn\_mode**

All objects	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8075
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	65535	0

**Description:** Selects the faults for which the acknowledge mode is to be changed

**Dependency:** Selects the faults and sets the required acknowledge mode realized under the same index  
Refer to: p2127

**Notice:** It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:  
- Fault number does not exist.  
- Message type is not "fault" (F).

**Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

---

**p2127[0...19] Sets acknowledgement mode / Acknowledge mode**

All objects	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1750, 8075
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	1	3	1

**Description:** Sets the acknowledge mode for selected fault.

**Value:**  
1: Acknowledgment only using POWER ON  
2: Ack IMMEDIATELY after the fault cause has been removed  
3: Acknowledgement only for PULSE INHIBIT

**Dependency:** Selects the faults and sets the required acknowledge mode realized under the same index  
Refer to: p2126

**Notice:** It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:  
- if there is no existing fault number.  
- the message type is not "fault" (F).

**Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.  
The acknowledge mode can only be changed for faults with the appropriate identification.

Example:

F12345 and acknowledge mode = IMMEDIATELY (POWER ON)

--> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

<b>p2128[0...15]      Selecting fault/alarm code for trigger / Message trigger</b>			
All objects	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the system runtime in days when the fault was removed.

**Dependency:** Refer to: r0945, r0947, r0948, r0949, r2109, r2114, r2130, r2133, r3115, r3120, r3122

**Notice:** The time comprises r2136 (days) and r2109 (milliseconds).

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

---

**r2138.7...15 CO/BO: Control word faults/alarms / STW fault/alarm**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1530, 2546
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the control word of the faults and alarms.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	07	Acknowledge fault	Yes	No	-
	10	External alarm 1 (A07850) effective	Yes	No	-
	11	External alarm 2 (A07851) effective	Yes	No	-
	12	External alarm 3 (A07852) effective	Yes	No	-
	13	External fault 1 (F07860) effective	Yes	No	-
	14	External fault 2 (F07861) effective	Yes	No	-
	15	External fault 3 (F07862) effective	Yes	No	-

**Dependency:** Refer to: p2103, p2104, p2105, p2106, p2107, p2108, p2112, p2116, p2117, p3110, p3111, p3112

---

**r2139.0...12 CO/BO: Status word faults/alarms 1 / ZSW fault/alarm 1**

All objects	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1530, 2548
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Displays the first status word of faults and alarms.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Being acknowledged	Yes	No	-
	01	Acknowledgment required	Yes	No	-
	03	Fault present	Yes	No	-
	05	Safety message present	Yes	No	-
	06	Internal message 1 present	Yes	No	-
	07	Alarm present	Yes	No	-
	08	Internal message 2 present	Yes	No	-

11	Alarm class bit 0	High	Low	-
12	Alarm class bit 1	High	Low	-

**Note:**

Re bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present"/"alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121).

Re bit 06, 08:

These status bits are used for internal diagnostic purposes only.

Re bit 11, 12:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

<b>p2140[0...n]</b>	<b>Hysteresis speed 2 / n_hysteresis 2</b>

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> 0	
<b>Description:</b>	Sets the signal source for the signal "ramp-function generator active" for the following signals/messages: "Speed setpoint - actual value deviation within tolerance t_on" (BO: r2199.4) "Ramp-up/ramp-down completed" (BO: r2199.5)			
<b>Notice:</b>	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.			
<b>Note:</b>	The binector input is automatically pre-assigned to r1199.2. The following applies for SERVO: The pre-assignment using the automatic calculation of the motor/control parameters in the drive (p0340 = 1, 3, 5) is only realized if, at the instant of the calculation, the "setpoint channel" function module is active (r0108.8 = 1). If the calculation in p0340 is not selected when downloading parameters, then the parameter is not preassigned.			

<b>p2149[0...n]</b>	<b>Monitoring configuration / Monit config</b>				
VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3		
	<b>Data type:</b> Unsigned16	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> 8010, 8013		
	<b>P-Group:</b> Messages	<b>Units group:</b> -	<b>Unit selection:</b> -		
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1		
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> 0000 0000 0000 0001 bin		
<b>Description:</b>	Sets the configuration for messages and monitoring functions.				
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Enable alarm A07903	Yes	No	8010
	01	Load monitoring only in the 1st quadrant	Yes	No	8013
	03	n_act > p2155 own hysteresis	Yes	No	8010
	15	Automatic parameterization carried out (p0340 = 1, p3900 > 0)	Yes	No	-
<b>Dependency:</b>	Refer to: r2197 Refer to: A07903				
<b>Note:</b>	Re bit 00: Alarm A07903 is output when the bit is set with r2197.7 = 0 (n_set <> n_act). Re bit 01: When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190). Re bit 03: When the bit is set, r2197 bit 1 and bit 2 are determined via separate hystereses. Re bit 15: The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out. If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

	<b>Min</b> 0.00 [rpm]	<b>Max</b> 60000.00 [rpm]	<b>Factory setting</b> 0.00 [rpm]
<b>Description:</b>	Sets the hysteresis speed (bandwidth) for the signal "n_act > n_max" (BO: r2197.6).		
<b>Dependency:</b>	Refer to: r1084, r1087, r2197		
<b>Notice:</b>	For p0322 = 0, the following applies: p2162 <= 0.1 * p0311 For p0322 > 0, the following applies: p2162 <= 1.02 * p0322 - p1082 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
<b>Note:</b>	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value.		

If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

<b>Description:</b>	Sets the configuration for the motorized potentiometer of the technology controller.			
<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>
	00	Data save active	Yes	No
	02	Initial rounding-off active	Yes	No
	03	Non-volatile data save active for p2230.0 = 1	Yes	No
	04	Ramp-function generator always active	Yes	No
				<b>FP</b> -
<b>Dependency:</b>	Refer to: r2231, p2240			
<b>Notice:</b>	The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion: - Firmware with V2.3 or higher. - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).			

**Note:**

Re bit 00:  
 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.  
 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.

Re bit 02:  
 0: Without initial rounding-off  
 1: With initial rounding-off.

The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).

It is calculated as follows:  

$$r = 0.0001 \times \max(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$

The jerk is effective until the maximum acceleration is reached ( $a_{\max} = p2237 [\%] / p2247 [s]$  or  $a_{\max} = p2238 [\%] / p2248 [s]$ ), after which the drive continues to run linearly with constant acceleration. The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:  
 0: Non-volatile data save de-activated.  
 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).

Re bit 04:  
 When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

### p2369 BI: Closed-loop cascade control, control word / Csc\_ctrl STW

VECTOR_G (Tech_ctrl)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned32 / Binary	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0

**Description:** Sets the signal source for the selection of the "Switch-in motor" function.  
When the function is selected, monitoring of the switches is de-activated with the "bypass" function. This means that the power unit can be connected to other motors via an external control without switch monitoring responding.

### r2700 CO: Reference frequency / f\_ref

B_INF	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Display and connector output of the actual reference quantity for the frequency (p2000).  
All frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
This parameter has the unit Hz.

**Dependency:** Refer to: p2000

**Note:** This BICO parameter provides the numerical value of the reference quantity p2000 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

### r2700 CO: Reference speed/reference frequency / n\_ref/f\_ref

ENC, VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Display and connector output for the reference quantity for speed and frequency (p2000).  
All speeds or frequencies specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
The following applies: Reference frequency (in Hz) = reference speed (in rpm) / 60  
This parameter has the unit rpm.

**Dependency:** Refer to: p2000

**Note:** This BICO parameter provides the numerical value of the reference quantity p2000 as a connector output for inter-connection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

---

**r2700 CO: Reference velocity/reference frequency actual / v\_ref/f\_ref act**

ENC (Lin_enc)	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Display and connector output for the actual reference quantity for velocity and frequency.  
All velocities or frequencies specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
The following applies: Reference frequency (in Hz) = reference velocity (in m/min) / 60

**Dependency:** Refer to: p2000

**Note:** This BICO parameter provides the numerical value of the reference quantity p2000 as a connector output for inter-connection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

---

**r2701 CO: Reference voltage / Reference voltage**

B_INF, VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Connector output of the reference quantity for voltages p2001.  
All voltages specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
This parameter has the unit Vrms.

**Dependency:** Refer to: p2001

**Note:** This BICO parameter provides the numerical value of the reference quantity p2001 as a connector output for inter-connection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

---

**r2702 CO: Reference current / Reference current**

B_INF, VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Connector output of the reference quantity for currents p2002.  
All currents specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
This parameter has the unit Arms.

**Dependency:** Refer to: p2002

**Note:** This BICO parameter provides the numerical value of the reference quantity p2002 as a connector output for inter-connection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

<b>r2703</b>	<b>CO: Reference torque / Reference torque</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Connector output of the reference quantity p2003 for torque (r0108.12 = 0) or force (r0108.12 = 1). All torques specified as relative values (r0108.12 = 0) or forces (r0108.12 = 1) are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The unit of this parameter is the same as the unit selected for p2003.		
<b>Dependency:</b>	p0505, r0108.12 Refer to: p2003		
<b>Note:</b>	This BICO parameter provides the numerical value of the reference quantity p2003 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.		
<b>r2704</b>	<b>CO: Reference power / Reference power</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Connector output of the reference quantity for powers p2004. All power ratings specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The unit of this parameter is the same as the unit selected for p2004.		
<b>Dependency:</b>	This value is calculated as voltage x current for the infeed and as torque x speed for closed-loop controls. Refer to: r2004		
<b>Note:</b>	This BICO parameter provides the numerical value of the reference quantity p2004 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication. The reference power is calculated as follows: - $2 * \pi * \text{reference speed} / 60 * \text{reference torque (motor)}$ - $\text{reference voltage} * \text{reference current} * \text{root}(3) \text{ (infeed)}$		
<b>r2705</b>	<b>CO: Reference angle / Reference angle</b>		
B_INF, VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Connector output of the reference quantity for angles p2005. All angles specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). This parameter has the unit degree.		
<b>Dependency:</b>	Refer to: p2005		

**Note:** This BICO parameter provides the numerical value of the reference quantity p2005 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

---

**r2706 CO: Reference temp / Reference temp**

B_INF, TM150, TM31, VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Connector output of the reference quantity for temperatures.  
All temperatures specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
This parameter has the unit degree Celsius.

**Note:** This BICO parameter provides the numerical value of the reference quantity for the temperature as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

---

**r2707 CO: Reference acceleration / Ref accel**

VECTOR_G	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	-

**Description:** Connector output of the reference quantity for accelerations p2007.  
All acceleration rates specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
The unit of this parameter is the same as the unit selected for p2007.

**Dependency:** r0108.12, p0505  
Refer to: p2007

**Note:** This BICO parameter provides the numerical value of the reference quantity p2007 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value in the currently selected unit can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

---

**p2720[0...n] Load gear configuration / Load gear config**

VECTOR_G	<b>Can be changed:</b> C2(1, 4)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> DDS, p0180	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 bin

**Description:** Sets the configuration for position tracking of a load gear.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Load gear, activate position tracking	Yes	No	-
	01	Axis type	Linear axis	Rotary axis	-
	02	Load gear, reset position	Yes	No	-

**Note:** For the following events, the non-volatile, saved position values are automatically reset:

- when an encoder replacement has been identified.
- when changing the configuration of the Encoder Data Set (EDS).
- when adjusting the absolute encoder again

<b>p2721[0...n]</b>	<b>Load gear, rotary absolute encoder, revolutions, virtual / Abs rot rev</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 4) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4194303	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.		
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).		
<b>Note:</b>	The resolution that is set must be able to be represented using r2723. For rotary axes/modulo axes, the following applies: This parameter is pre-set with p0421 and can be changed. For linear axes, the following applies: This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.		
<b>p2722[0...n]</b>	<b>Load gear, position tracking tolerance window / Pos track tol</b>		
VECTOR_G	<b>Can be changed:</b> C2(1, 4) <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0.00	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4294967300.00	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00
<b>Description:</b>	Sets a tolerance window for position tracking. After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output.		
<b>Dependency:</b>	Refer to: F07449		
<b>Caution:</b>	Rotation, e.g. through a complete encoder range is not detected.		
			
<b>Note:</b>	The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).		
<b>r2723[0...n]</b>	<b>CO: Load gear absolute value / Load gear abs_val</b>		
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Unsigned32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 1 <b>Func. diagram:</b> 4010, 4704 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the absolute value after the load gear.		
<b>Notice:</b>	The encoder position actual value must be requested using the encoder control word Gn_STW.13.		
<b>Note:</b>	The increments are displayed in the format the same as r0483.		

<b>r2724[0...n]</b>	<b>CO: Load gear position difference / Load gear pos diff</b>			
VECTOR_G	<b>Can be changed:</b> - <b>Data type:</b> Integer32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 1 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -	
<b>Description:</b>	Displays the position difference before the load gear between powering down and powering up.			
<b>Note:</b>	The increments are displayed in the same format as for r0483/r2723. If the measuring gear of the motor encoder is not activated, the position difference should be read in encoder increments. If the measuring gear of the motor encoder is activated, the position difference is converted using the measuring gear factor.			
<b>p2810[0...1]</b>	<b>BI: AND logic operation inputs / AND inputs</b>

<b>p3800[0...n]</b>	<b>Sync-line-drive activation / Sync act</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 2 <b>Func. diagram:</b> 7020 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Sets the activation for the line-drive synchronization.		
<b>Value:</b>	0: Sync-line-drive de-activated 1: Sync-line-drive activated VSM-INT		
<b>Dependency:</b>	Refer to: p3801, p3802		
<b>Note:</b>	When the ground fault monitoring initiates a fault for overlapping synchronizing the threshold value p0287[1] for the Motor Module and the associated infeed must be appropriately increased (e.g. p0287[1] = 100 %). For p3800 = 1, the following applies: The INTERNAL voltage actual values are used for synchronization. The effects that a (sine-wave) filter - that is connected between the Motor Module and motor - has on the voltage actual values are taken into account (theoretically) by appropriately selecting p0230. VSM: Voltage Sensing Module		
<b>p3801[0...n]</b>	<b>Sync-line-drive, drive object number / Sync DO_No</b>		
VECTOR_G	<b>Can be changed:</b> T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Functions <b>Not for motor type:</b> - <b>Min</b> 1	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 62	<b>Access level:</b> 2 <b>Func. diagram:</b> 7020 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 1
<b>Description:</b>	Sets the drive object number of the Voltage Sensing Module (VSM) used for the line-drive synchronization.		
<b>Dependency:</b>	Refer to: p3800, p3802		
<b>Notice:</b>	The current controller sampling time p0115[0] of the drive object with the VSM used for synchronization must be identical to the current controller sampling time of the drive of the drive used to perform line synchronization.		
<b>Note:</b>	VSM: Voltage Sensing Module The setting p3801 = 1 is always possible (no VSM selected). If the VSM is assigned subsequently to a Motor Module, its drive object number must be entered in p3801. The line voltage is always measured using the first VSM (see p0151 index 0).		
<b>p3802[0...n]</b>	<b>BI: Sync-line-drive enable / Sync enable</b>

<b>Dependency:</b>	Refer to: p3844		
<b>p3844[0...n]</b>	<b>Friction characteristic number changeover point upper / Frict chngov pt up</b>		
VECTOR_G (n/M)	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned8 <b>P-Group:</b> Closed-loop control <b>Not for motor type:</b> PEM, REL, FEM <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> DDS, p0180 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 4	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor.  The speed of this changeover point is preassigned when automatically calculating with the changeover speed p1752. The changeover point located below is preassigned with the changeover speed p1752 * (1 - p1753). Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3).  Depending on the display of r3840 bit 9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.		

- Dependency:** As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder.  
Refer to: p3843
- Notice:** If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).
- Note:** For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.

---

**p3845 Friction characteristic record activation / Frict rec act**

VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 7010
	<b>P-Group:</b> Functions	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> REL	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	3	0

**Description:** Setting for the friction characteristic record.

After the next power-on command, the friction characteristic is automatically recorded.

**Value:**

- 0: Friction characteristic record de-activated
- 1: Friction char record activated for all directions
- 2: Friction char record activated for positive direction
- 3: Friction char record activated for negative direction

**Dependency:** When selecting the friction characteristic measurement, the drive data set changeover is suppressed.  
For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.

**Danger:**

For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.

**Notice:** To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

**Note:** When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).

When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.

When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.

---

**p3846[0...n] Friction characteristic record ramp-up/ramp-down time / Frict rec t\_RFG**

**p3900 Completion of quick commissioning / Compl quick\_comm**

B_INF	<b>Can be changed:</b> C2(1)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	3	0

**Description:** Exits the quick commissioning (p0010 = 1) with automatic calculation of all of the parameters that depend on the entries made during the quick commissioning.  
p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning. The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700 are re-established and all of the dependent filter and closed-loop control parameters are calculated (corresponding to p0340 = 1).

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the end of quick commissioning.

**Value:**

- 0: No quick parameterization
- 1: Quick parameterization after parameter reset
- 2: Quick param. (only) for controller par. and reset for BICO par
- 3: Completion of quick commissioning

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of 0.

---

### **p3900 Completion of quick commissioning / Compl quick\_comm**

<b>VECTOR_G</b>	<b>Can be changed:</b> C2(1)	<b>Calculated:</b> -	<b>Access level:</b> 1
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	3	0

**Description:** Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning.

p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning.

The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1.

**Value:**

- 0: No quick parameterization
- 1: Quick parameterization after parameter reset
- 2: Quick parameterization (only) for BICO and motor parameters
- 3: Quick parameterization for motor parameters (only)

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of 0.

When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

If a catalog motor has not been selected (see p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time:

induction motors p0320, p0352, p0353, p0362 ... p0369, p0391 ... p0393, p0604, p0605, p0626 ... p0628

synchronous motor p0326, p0327, p0352, p0353, p0391 ... p0393, p0604, p0605.

---

### **p3901[0...n] Power unit EEPROM Vdc offset calibration / PU EEPROM Vdc\_offs**

<b>B_INF, VECTOR_G</b>	<b>Can be changed:</b> C1, C2(1), T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> PDS, p0120	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-40.0 [V]	40.0 [V]	0.0 [V]

**Description:** Differential voltage for calibrating the offset for DC-link voltage measurement.

**Dependency:** Refer to: r0192, p0212

**Caution:** Incorrect use of the calibration can have a negative impact on the closed-loop control. The parameter influences the upper and lower voltage detection.

**Note:** Parameter entries are directly saved in the DRIVE-CLiQ component involved.  
The parameter is only effective in the case of booksize power units if r0192 bit 22 and p0212 bit 0 are set.

r3925[0...n]				
Identification final display / Ident final_disp				
VECTOR_G	Can be changed: -		Calculated: CALC_MOD_ALL	Access level: 3
	Data type: Unsigned32		Dynamic index: DDS, p0180	Func. diagram: -
	P-Group: Motor		Units group: -	Unit selection: -
	Not for motor type: -		Scaling: -	Expert list: 1
	Min	Max	Factory setting	
	-	-	-	
Description:	Displays the commissioning steps that have been carried out.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Motor/control parameters calculated (p0340 = 1, p3900 > 0)	Yes	No
	02	Motor data identification carried out at standstill (p1910 = 1)	Yes	No
	03	Rotating measurement carried out (p1960 = 1, 2)	Yes	No
	04	Motor encoder adjustment carried out (p1960 = 1, p1990 = 1,3)	Yes	No
	10	Automatic parameterization only for U/f control (r0108.2 = 0)	Yes	No
	15	Motor equivalent circuit diagram parameters changed	Changed	Not changed
Note:	The individual bits are only set if the appropriate action has been initiated and successfully completed. When motor rating plate parameters are changed, the final display is reset. When setting the individual bits, all of the most significant bits are reset.

- 3: Unipolar current input monitored (+4 mA to +20 mA)
- 4: Bipolar voltage input (-10 V ... +10 V)
- 5: Bipolar current input (-20 mA to +20 mA)

**Index:**

- [0] = AI 0 (X521.1/X521.2, S5.0)
- [1] = AI 1 (X521.3/X521.4, S5.1)

**Warning:** The maximum voltage difference between the analog input terminals AI+, AI- and the ground of the TM31 (X520.6, X530.3) may not exceed 35 V.

For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 15 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.

**Notice:** For operation as a voltage input/current input, switch S5.0 or S5.1 must be appropriately set.

**Note:** When changing p4056, the parameters of the scaling characteristic (p4057, p4058, p4059, p4060) are overwritten with the following default values:

For p4056 = 0, 4, p4057 is set to 0.0 V, p4058 to 0.0 %, p4059 to 10.0 V and p4060 to 100.0 %.

For p4056 = 2, 5, p4057 is set to 0.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.

For p4056 = 3, p4057 is set to 4.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.

### p4057[0...1] TB30 analog inputs, characteristic value x1 / TB30 AI char x1

<b>TB30</b>	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9104
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-11.000 [V]	11.000 [V]	0.000 [V]

**Description:** Sets the scaling characteristic for the analog inputs of Terminal Board 30 (TB30).  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the x coordinate (input voltage in V) of the 1st value pair of the characteristic.

**Index:**

- [0] = AI 0 (X482.1/X482.2)
- [1] = AI 1 (X482.3/X482.4)

**Note:** The parameters for the characteristic do not have a limiting effect.

### p4057[0...1] TM31 analog inputs, characteristic value x1 / TM31 AI char x1

<b>TM31</b>	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9566, 9568
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-20.000	20.000	0.000

**Description:** Sets the scaling characteristic for the analog inputs of Terminal Module 31 (TM31).  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the x coordinate (input voltage in V or input current in mA) of the 1st value pair of the characteristic.

**Index:**

- [0] = AI 0 (X521.1/X521.2, S5.0)
- [1] = AI 1 (X521.3/X521.4, S5.1)

**Dependency:** The unit of this parameter (V or mA) depends on the analog input type.  
Refer to: r4056, p4056

**Notice:** This parameter is automatically overwritten when the analog input type (p4056) is modified.

**Note:** The parameters for the characteristic do not have a limiting effect.

**p4058[0...1] TB30 analog inputs, characteristic value y1 / TB30 AI char y1**

TB30	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9104
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -1000.00 [%]	<b>Max</b> 1000.00 [%]	<b>Factory setting</b> 0.00 [%]

**Description:** Sets the scaling characteristic for the analog inputs of Terminal Board 30 (TB30).  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the y coordinate (percentage) of the 1st value pair of the characteristic.

**Index:** [0] = AI 0 (X482.1/X482.2)  
[1] = AI 1 (X482.3/X482.4)

**Note:** The parameters for the characteristic do not have a limiting effect.

**p4058[0...1] TM31 analog inputs, characteristic value y1 / TM31 AI char y1**

TM31	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9566, 9568
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -1000.00 [%]	<b>Max</b> 1000.00 [%]	<b>Factory setting</b> 0.00 [%]

**Description:** Sets the scaling characteristic for the analog inputs of Terminal Module 31 (TM31).  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the y coordinate (percentage) of the 1st value pair of the characteristic.

**Index:** [0] = AI 0 (X521.1/X521.2, S5.0)  
[1] = AI 1 (X521.3/X521.4, S5.1)

**Notice:** This parameter is automatically overwritten when the analog input type (p4056) is modified.

**Note:** The parameters for the characteristic do not have a limiting effect.

**p4059[0...1] TB30 analog inputs, characteristic value x2 / TB30 AI char x2**

TB30	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9104
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -11.000 [V]	<b>Max</b> 11.000 [V]	<b>Factory setting</b> 10.000 [V]

**Description:** Sets the scaling characteristic for the analog inputs of Terminal Board 30 (TB30).  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the x coordinate (input voltage in V) of the 2nd value pair of the characteristic.

**Index:** [0] = AI 0 (X482.1/X482.2)  
[1] = AI 1 (X482.3/X482.4)

**Note:** The parameters for the characteristic do not have a limiting effect.

**p4059[0...1] TM31 analog inputs, characteristic value x2 / TM31 AI char x2**

TM31	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9566, 9568

AI: Analog Input

<b>p4098[0...1] TM31 analog inputs simulation mode setpoint / TM31 AI sim setp</b>			
TM31	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 9566, 9568
	<b>P-Group:</b> Terminals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -20.000	<b>Max</b> 20.000	<b>Factory setting</b> 0.000
<b>Description:</b>	Sets the setpoint for the input value in simulation mode of the analog inputs of Terminal Module 31 (TM31).		
<b>Index:</b>	[0] = AI 0 (X521.1/X521.2, S5.0) [1] = AI 1 (X521.3/X521.4, S5.1)		
<b>Dependency:</b>	The simulation of an analog input is selected using p4097. If AI x is parameterized as voltage input (p4056), then the setpoint is a voltage in V. If AI x is parameterized as current input (p4056), then the setpoint is a current in mA. Refer to: r4056, p4056, p4097		
<b>Note:</b>	This parameter is not saved when data is backed-up (p0971, p0977). AI: Analog Input		

<b>p4099[0...2] TB30 inputs/outputs, sampling time / TB30 I/O t_sample</b>			
TB30	<b>Can be changed:</b> C1(3)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1790, 9100
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.00 [µs]	<b>Max</b> 5000.00 [µs]	<b>Factory setting</b> [0] 4000.00 [µs] [1] 4000.00 [µs] [2] 4000.00 [µs]
<b>Description:</b>	Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).		
<b>Index:</b>	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Analog outputs (AO)		
<b>Dependency:</b>	The parameter can only be modified for p0009 = 3, 29. The sampling times can only be set as an integer multiple of the basic sampling time (r0110, r0111). Refer to: p0009, r0110, r0111		
<b>Note:</b>	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. A/D converter ) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is powered down. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].		

<b>p4099[0...2] TM31 inputs/outputs, sampling time / TM31 I/O t_sample</b>			
TM31	<b>Can be changed:</b> C1(3)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dynamic index:</b> -	<b>Func. diagram:</b> 1840, 9550
	<b>P-Group:</b> Commands	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> 0.00 [µs]	<b>Max</b> 5000.00 [µs]	<b>Factory setting</b> 4000.00 [µs]
<b>Description:</b>	Sets the sampling time for the inputs and outputs of Terminal Module 31 (TM31).		
<b>Index:</b>	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Analog outputs (AO)		

- Dependency:** The parameter can only be modified for p0009 = 3, 29.  
The sampling times can only be set as an integer multiple of the DRIVE-CLiQ clock cycle.  
The minimum permissible sampling time is 125µs.  
Refer to: p0009, r0110, r0111
- Notice:** The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).
- Note:** The changed sampling time is immediately effective after a completed sub-boot (p0009 → 0).  
Parameter p4099[0] must never be equal to zero.

p4100[0...11]		TM150 sensor type / TM150 sensor type	
TM150	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> 0 <b>Max</b> 6	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 6	<b>Access level:</b> 1 <b>Func. diagram:</b> 9626, 9627 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 5
<b>Description:</b>	Sets the sensor type for Terminal Module 150 (TM150) This means that the temperature sensor type is selected and the evaluation is switched in.		
<b>Value:</b>	0: Evaluation disabled 1: PTC thermistor 2: KTY84 4: Bimetallic NC contact 5: PT100 6: PT1000		
<b>Index:</b>	[0] = Temperature channel 0 [1] = Temperature channel 1 [2] = Temperature channel 2 [3] = Temperature channel 3 [4] = Temperature channel 4 [5] = Temperature channel 5 [6] = Temperature channel 6 [7] = Temperature channel 7 [8] = Temperature channel 8 [9] = Temperature channel 9 [10] = Temperature channel 10 [11] = Temperature channel 11		
<b>Notice:</b>	For p4102[0...23] = 251 °C, evaluation of the corresponding threshold is deactivated. For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies: To activate the corresponding alarm or fault, p4102[0...23] must be set <= 250 °C.		
<b>Note:</b>	The temperature sensors are connected to the following terminals: X531 = channel 0 (for 2x2 conductor evaluation, additionally channel 6) X532 = channel 1 (for 2x2 conductor evaluation, additionally channel 7) X533 = channel 2 (for 2x2 conductor evaluation, additionally channel 8) X534 = channel 3 (for 2x2 conductor evaluation, additionally channel 9) X535 = channel 4 (for 2x2 conductor evaluation, additionally channel 10) X536 = channel 5 (for 2x2 conductor evaluation, additionally channel 11) Details on the wiring are included in the parameter description for p4108.		

p4100		TM31 sensor type / TM31 sensor type		
TM31	<div><div>Can be changed: T</div><div>Data type: Integer16</div><div>P-Group: -</div><div>Not for motor type: -</div><div>Min</div><div>0</div></div>	<div><div>Calculated: -</div><div>Dynamic index: -</div><div>Units group: -</div><div>Scaling: -</div><div>Max</div><div>2</div></div>	<div><div>Access level: 1</div><div>Func. diagram: 9576</div><div>Unit selection: -</div><div>Expert list: 1</div><div>Factory setting</div><div>0</div></div>	
Description:	Sets the sensor type for Terminal Module 31 (TM31)			

This means that the temperature sensor type is selected and the evaluation is switched in.

**Value:**

- 0: Evaluation disabled
- 1: PTC thermistor
- 2: KTY84

**Notice:** For p4102[0...1] = 251 °C, evaluation of the corresponding threshold is deactivated.  
For sensor type "PTC thermistor" (p4100 = 1), the following applies:

To activate the corresponding alarm or fault, p4102[0...1] must be set ≤ 250 °C.

**Note:** The temperature sensor is connected at terminals X522.7(+) and X522.8(-).

---

#### **r4101[0...11]    TM150 sensor resistance / TM150 R\_sensor**

TM150	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3

<b>Note:</b>	The hysteresis can be set in p4118[0...11].		

<b>p4102[0...1]</b>	<b>TM31 fault threshold/alarm threshold / TM31 F/A_thresh</b>		
TM31	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> - <b>Not for motor type:</b> - <b>Min</b> -48 [°C]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 251 [°C]	<b>Access level:</b> 1 <b>Func. diagram:</b> 9576 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> [0] 100 [°C] [1] 120 [°C]
<b>Description:</b>	Sets the fault threshold/alarm threshold for Terminal Module 31 (TM31). A35211 is initiated, if the temperature actual value r4105[0] > p4102[0] F35207 is initiated if the temperature actual value r4105[0] > p4102[1] or timer p4103[0] has expired For alarm A35211 the following applies: - Remains until the temperature actual value (r4105) reaches or falls below the value (p4102[0] - hysteresis). For fault F35207 the following applies: - Remains until the temperature actual value (r4105) reaches or falls below the value (p4102[1] - hysteresis) and the fault has been acknowledged. - The hysteresis value is 5 K and cannot be changed by the user.		
<b>Index:</b>	[0] = Alarm threshold [1] = Fault threshold		
<b>Dependency:</b>	Refer to: r4104		
<b>Caution:</b>	Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31. For p4102[0...1] = 251 °C, evaluation of the corresponding threshold is deactivated. For sensor type "PTC thermistor" (p4100 = 1), the following applies: To activate the alarm or fault, p4102[0...1] must be set <= 250 °C.		
<b>p4103[0...11]</b>	<b>TM150 delay time / TM150 t_delay</b>		
TM150	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Motor <b>Not for motor type:</b> - <b>Min</b> 0.0 [s]	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 600.0 [s]	<b>Access level:</b> 1 <b>Func. diagram:</b> 9626, 9627 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.0 [s]
<b>Description:</b>	Sets the delay time for the output of the fault for the Terminal Module 150 (TM150). The timer is started when the alarm threshold (e.g. p4102[0]) is exceeded. If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then the corresponding fault is output. The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below. For sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies: - If the fault threshold (e.g. p4102[1]) is exceeded before the delay time has expired, then the corresponding fault is immediately output. For sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies: - Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.		
<b>Index:</b>	[0] = Temperature channel 0 [1] = Temperature channel 1 [2] = Temperature channel 2 [3] = Temperature channel 3 [4] = Temperature channel 4 [5] = Temperature channel 5 [6] = Temperature channel 6 [7] = Temperature channel 7 [8] = Temperature channel 8 [9] = Temperature channel 9		

[10] = Temperature channel 10

[11] = Temperature channel 11

**Dependency:**

Refer to: p4102, r4104, r4105, p4118

**Warning:**

The fault F35207 ... F35210 and F35400 ... 35407 only results in the drive being shut down if at least one BICO interconnection exists between the drive and the TM150.

**Note:**

For p4103 = 0 s and sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies:

- The corresponding fault can only be initiated via the fault threshold (output of the timer is always a logical 0).

For p4103 = 0 s and sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:

- The corresponding alarm and fault are simultaneously output (delay time = 0 s).

0.000 [ms]

**Description:**

Sets the delay time for the output of the fault for the Terminal Module 31 (TM31).

The timer is started when the alarm threshold (p4102[0]) is exceeded.

If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F35207 is output.

The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.

For sensor type "KTY84" (p4100 = 2), the following applies:

If the fault threshold (p4102[1]) is exceeded before the delay time has expired, then fault F35207 is immediately output.

For sensor type "PTC thermistor" (p4100 = 1), the following applies:

- Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.

**Dependency:**

Refer to: r4104

**Warning:**

Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.

**Note:**

With p4103 = 0 ms, the timer is de-activated and only the fault threshold is effective.

1

0

**Description:**

Setting to start the measurement of the conductor resistance for a channel for the Terminal Module 150 (TM150).

For a 2 conductor evaluation, the total conductor resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured cable resistance.

Procedure:

1. Select the measuring method (1x2/2x2) for the corresponding terminal block (p4108[0...5] = 0, 1).
2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11).
3. Jumper the sensor to be connected (short-circuit the sensor conductor close to the sensor).
4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-).
5. For the corresponding channel, start the measurement of the conductor resistance (p4109[x] = 1).
6. After p4109[x] = 0, check the measured resistance value in p4110[x].
7. Remove the jumper across the temperature sensor.

**Value:**

0: Inactive

1: Start

**Index:**

[0] = Temperature channel 0

[1] = Temperature channel 1

[2] = Temperature channel 2

[3] = Temperature channel 3

[4] = Temperature channel 4

[5] = Temperature channel 5

[6] = Temperature channel 6

[7] = Temperature channel 7

[8] = Temperature channel 8

[9] = Temperature channel 9

[10] = Temperature channel 10

[11] = Temperature channel 11

**Dependency:**

Refer to: p4100, p4108, p4110

**Notice:**

Conductor resistance measurement is only possible for 1x2 or 2x2 conductor evaluation (p4108[0...5] = 0, 1).

**Note:**

The conductor resistance value can be also directly entered into p4110[0...11].

The automatic conductor calibration for 1x2 and 2x2 conductor evaluation is always performed with the value in p4110[0...11].

	- [ms]	- [ms]	- [ms]

**Description:** Displays the smoothing time constant for the temperature filter for Terminal Module 150 (TM150).

**Dependency:** Refer to: r4105, p4111, r4112, r4113

**Note:** The time constant lies in the range from 80 to 1000 ms and depends on the number of channels that are simultaneously active.

**p4121 TM150 filter rated line frequency / TM150 filt f\_line**

TM150	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 1

**p4670[0...n] Analog sensor configuration / Ana\_sens config**

ENC, VECTOR_G	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 4
	<b>Data type:</b> Unsigned32	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> -	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 0000 0000 0000 0000 0000 0000 0000 bin

**Description:** Sets the configuration for evaluation on the analog sensor.

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	06	Set velocity to 0	Yes	No	-
	08	Pos val range	0.0 / 1.0 pulse	-0.5 / +0.5 pulse	-
	09	Fault/alarm messages	Alarm	Fault	-
	10	Chann B act	Yes	No	-
	11	Chann A act	Yes	No	-
	13	Commutation angle constant	Yes	No	-
	14	Suppress faults	Yes	No	-
	31	Extrapolation	ON	OFF	-

**Notice:** Re bit 06:

Setting the bit sets the velocity actual value (r0061) permanently to 0.

Re bit 13:

Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).

**Note:** Re bit 09:  
 A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.  
 A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.  
 Re bit 10, 11:  
 If both channels are activated, the actual value is generated from the mean value of both channels. If a channel fails (actual value invalid), it is not included when the mean value is generated.  
 Re bit 14:  
 The bit is only evaluated for encoder 1. No effect for encoder 2 and encoder 3.

<b>p4671[0...n]</b>	<b>Analog sensor input / Ana_sens inp</b>

<b>Description:</b>	Sets the ratio for the LVDT sensor.		
<b>p4679[0...n]</b>	<b>Analog sensor LVDT phase / An_sens LVDT ph</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4), T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> -360.00 [°]	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 360.00 [°]	<b>Access level:</b> 4 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0.00 [°]
<b>Description:</b>	Sets the phase for the LVDT sensor.		
<b>p4680[0...n]</b>	<b>Zero mark monitoring tolerance permissible / ZM_monit tol perm</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 4
<b>Description:</b>	Sets the permissible tolerance in encoder pulses for the zero mark distance in the context of zero mark monitoring. Causes fault F3x100 to appear less frequently.		
<b>Dependency:</b>	Refer to: p0430 Refer to: F31100		
<b>Note:</b>	The parameter is activated using p0430.21 = 1 (zero mark tolerance).		
<b>p4681[0...n]</b>	<b>Zero mark monitoring, tolerance window limit 1 positive / ZM tol lim 1 pos</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned32 <b>P-Group:</b> Encoder <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> EDS, p0140 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1000	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 2
<b>Description:</b>	Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, then the pulse number is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.		
<b>Dependency:</b>	Refer to: p0437, p4688 Refer to: F31131		
<b>Note:</b>	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). The positive limit describes additional pulses due to EMC.		

<b>p4682[0...n]</b>	<b>Zero mark monitoring, tolerance window limit 1 negative / ZM tol lim 1 neg</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer32	<b>Dynamic index:</b> EDS, p0140	<b>Func. diagram:</b> -
	<b>P-Group:</b> Encoder	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -1001	<b>Max</b> 0	<b>Factory setting</b> -1001
<b>Description:</b>	Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.		
<b>Dependency:</b>	Refer to: p0437, p4681, p4688 Refer to: F31131		
<b>Note:</b>	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 is effective. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.		
<b>p4683[0...n]</b>	<b>Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos</b>		
ENC, VECTOR_G	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3

**Description:** Setting for the saving/downloading/deletion of motor and/or encoder data for the component specified in p4690 (SMI/DQI).

A backup of this data can be saved to non-volatile memory. The backup procedure is performed automatically as part of the function for saving to non-volatile memory (p0977 = 1 or "Copy RAM to ROM"). If a part is replaced, the saved data can be reloaded.

Procedure:

p4690 = set component number

p4691 = 1, 2, 30: Set the required procedure (save/download/delete).

p4691 = 9, 10, 36: Feedback signal on successful completion of the procedure.

p4691 = 11... 22, 37, 38: Error values if the procedure could not be executed successfully.

**Value:**

- 0: Inactive
- 1: Save SMI data
- 2: Download SMI data
- 9: SMI data downloaded and POWER ON required for component
- 10: SMI data backup complete
- 11: SMI data backup for selected component not found
- 12: Selected component not available or not connected
- 13: Insufficient memory space for backup
- 14: Format of saved data is incompatible
- 15: Transfer fault during data download
- 16: Transfer fault during data backup
- 17: Data backup does not match parameterized encoder/motor
- 18: Data backup directory not permissible
- 19: Component already contains data
- 20: Component does not contain any data
- 21: Component is not an SMI or a DQI
- 22: SMI data cannot be downloaded for component
- 30: Delete SMI data
- 35: Confirmation of SMI data delete required
- 36: SMI data deleted and POWER ON required for component
- 37: Access level not sufficient for delete
- 38: Delete SMI data not permitted for component
- 39: SMI data for component cannot be deleted

**Dependency:**

Refer to: p4690, p4692, p4693

**Notice:**

Once SMI/DQI data has been deleted or downloaded successfully, the component has to be powered up.

**Note:**

SMI: SINAMICS Sensor Module Integrated

DQI: DRIVE-CLiQ Sensor Integrated

Help for error value = 11:

- Save the data for the original SMI on the memory card.
- Use an SMI with a suitable hardware version.

Help for error value = 12:

- Set the correct component number or connect the component.

Help for error value = 13:

- Use a memory card with more memory space.

Help for error value = 14:

- Create a data backup on the memory card corresponding to the SMI type.

Help for error value = 15:

- Check the DRIVE-CLiQ wiring for the component.

Help for error value = 16:

- Check the DRIVE-CLiQ wiring for the component.

Help for error value = 17:

- Save the data for the original SMI on the memory card.

Help for error value = 18:

- Set parameter p4693 to an appropriate value.

Help for error value = 19:

- Perform an SMI delete or use a blank SMI.

Help for error value = 20:

- Use an SMI that is not blank.

Help for error value = 21:

- Set the correct component number (p4690).

Note for error value = 22:

- Data cannot be downloaded for component.

Help for error value = 35:

- Reset parameter p4691 to 30.

Help for error value = 37:

- Set the access level to Expert or higher.

Help for error value = 38:

- Insert the SMI/DQI into the actual topology as an additional component (component number >= 200).

- Set the component number from the actual topology (p4690 >= 200).

- Set the correct component number (p4690 >= 200).

Note for error value = 39:

- SMI already deleted or too old. Delete not possible.

**p4692****SMI spare part save data of all SMIs / Save SMI data**

29

0

**Description:**

Setting to back up the data of all SMIs and DQIs featured in the target topology.

**Value:**

0: Inactive  
1: Save data of all SMIs and DQIs  
10: Save all data successful  
13: Insufficient memory space for backup  
16: Transfer fault during data backup  
20: Component does not contain any data  
29: Not all components from target topology saved

**Note:**

SMI: SINAMICS Sensor Module Integrated

p4692 = 10: Automatic on successful completion of backup procedure.

p4692 = 13, 16, 20, 29: Error values if the procedure could not be executed successfully.

The procedure must be repeated if the data save operation was interrupted (e.g. if the power supply voltage failed).

Help for error value = 13:

- Use a memory card with more memory space.

Help for error value = 16:

- check the DRIVE-CLiQ connection.

Help for error value = 20:

- Use an SMI that is not blank.

Help for error value = 29:

- Check and correct the target and actual topologies for the SMIs.

- Repeat the save procedure.

0

399

0

**Description:**

Sets the directory for downloading and saving data.

Example:

The SMI has the component number 5 and the SMI data (motor/encoder data) is to be stored in subdirectory C205.

--> p4690 = 5, p4693[0] = 205, p4691 = 1

**Index:**

[0] = Subdirectory selection

[1] = Reserved

**Dependency:**

Refer to: p4691, r4694

**Notice:** If p4693[0] is not equal to 0 and p4693[0] is not equal to p4690, the following applies:

- Only a number  $\geq 200$  may be selected for the subdirectory when saving.
- In the case of downloads, a selection for the subdirectory may only be made for an SMI/DQI with a component number  $\geq 200$  (preliminary component number) (p4690  $\geq 200$ ).

**Note:** DQI: DRIVE-CLiQ Sensor Integrated  
SMI: SINAMICS Sensor Module Integrated  
Re index 0:  
This index is used to select the subdirectory for saving and downloading data. The motor order number (MLFB) of the corresponding data backup is displayed in r4694.  
For p4693[0] = 0, the following applies:  
The directory is determined by the setting of p4690.

r4694[0...19]		SMI spare part data backup motor order number / SMI dat_bkup MLFB	
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned8	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Displays, signals	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b> -	<b>Max</b> -	<b>Factory setting</b> -
<b>Description:</b>		Displays the motor order number (MLFB) of the data backup selected with p4693.	
<b>Dependency:</b>		Refer to: p4691, p4692	
<b>Caution:</b>		If the selected subdirectory contains a number of data sets, "More Datasets" is displayed in r4694[0...19].	
	If there is no SMI data (motor/encoder data) in the selected subdirectory or if the selected subdirectory does not exist, the following applies:		
	- The number of the next subdirectory located is displayed.		
	- This subdirectory is not checked for valid SMI data.		
	- If another subdirectory cannot be located, nothing is displayed in r4694[0...19].		
<b>Note:</b>		SMI: SINAMICS Sensor Module Integrated

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN	<b>Can be changed:</b> - <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Trace and function generator <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 0 <b>Factory setting</b> -
<b>Description:</b>	Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

**Description:** Displays the trace buffer (record buffer) for trace 0 and signal 0 as integer number.

**Note:** For signals, data type I32 or U32, the trace buffer is assigned as follows:  
r4760[0] = value 0  
r4760[1] = value 1  
...  
r4760[8191] = value 8191  
For signals, data type I16 or U16, the trace buffer is assigned as follows:  
r4760[0] = value 0 (bit 31 ... 16) and value 1 (bit 15 ... 0)  
r4760[1] = value 2 (bit 31 ... 16) and value 3 (bit 15 ... 0)  
...  
r4760[8191] = value 16382 (bit 31 ... 16) and value 16383 (bit 15 ... 0)  
For signals, data type I8 or U8, the trace buffer is assigned as follows:  
r4760[0] = value 0 (bit 31 ... 24) value 1 (bit 23 ... 16) value 2 (bit 15 ... 8) value 3 (bit 7 ... 0)  
r4760[1] = value 4 (bit 31 ... 24) value 5 (bit 23 ... 16) value 6 (bit 15 ... 8) value 7 (bit 7 ... 0)  
...  
r4760[8191] = value 32764 (bit 31 ... 24) value 32765 (bit 23 ... 16) value 32766 (bit 15 ... 8) value 32767 (bit 7 ... 0)

<b>p6397</b>		<b>Motor module phase shift second system / MM ph_sh 2nd sys</b>	
VECTOR_G	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Integer16	<b>Dynamic index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Converter	<b>Units group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	2	0
<b>Description:</b>	Sets the phase shift of the second system with respect to the first system for the motor module for a 12-pulse gating unit.		
<b>Value:</b>	0:      Shift by +30 ° 1:      Shift by -30 ° 2:      Shift by 0 °		
<b>Dependency:</b>	Refer to: p7003		
<b>Notice:</b>	The parameter is only evaluated if p7003 = 2.		
<b>Note:</b>	For p6397 = 0 the following applies: The second systems leads for a positive direction of rotation. For p6397 = 1 the following applies: The second systems lags for a positive direction of rotation.		

<b>r7000</b>	<b>Par_circuit No. of active power units / Qty active PU</b>

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	0	1	1	
<b>Description:</b>	Enables the power units in the parallel circuit configuration.			
<b>Value:</b>	0: De-activated 1: Activated			
<b>Dependency:</b>	Refer to: r7000			
<b>Note:</b>	For motors with separate winding systems (p7003 = 1) it is not possible to inhibit an individual power unit. p7001 is automatically reset if a power unit is de-activated via p0125 or p0895.			

<b>r7002[0...n]</b>	<b>Par_circuit status power units / Status PU</b>		
B_INF (Parallel), VECTOR_G (Parallel)	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> Modulation <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> PDS, p0120 <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
<b>Description:</b>	Displays the status of the power units in the parallel circuit configuration.		
<b>Value:</b>	0: Pulses inhibited 1: Pulses enabled		
<b>Dependency:</b>	Refer to: r7000, p7001		
<b>p7003</b>	<b>Par_circuit winding system / Wind_sys</b>		
VECTOR_G (Parallel)	<b>Can be changed:</b> C2(2) <b>Data type:</b> Integer16 <b>P-Group:</b> Converter <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dynamic index:</b> - <b>Units group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
<b>Description:</b>	Specifies the motor winding system when power units are connected in parallel.		
<b>Value:</b>	0: One-winding system 1: Several separate winding systems or motors 2: Two separate offset winding systems		
<b>Dependency:</b>	Re p7003 = 2: In order to permit separate, offset winding systems, wobulation must first be deactivated (p1810.2 = 0). The magnitude and direction of the offset is parameterized in p6397. When exiting commissioning, the circulating current control is automatically deactivated (p7035 = 0), and the compensation of the valve interlocking times is replaced by the appropriate stator resistance adaptation (p1780.7 = 1). Refer to: p1802, p6397		
<b>Note:</b>	Re p7003 = 0: - the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352. - the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1). - individual Motor Modules can be activated and de-activated (p7001). Re p7003 = 1, 2: - the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352). - all Motor Modules are activated. It is not possible to de-activate a motor model.		
<b>p7010</b>	<b>Par_circuit current dissymmetry alarm threshold / i_dissym A thresh</b>
